EchoMark

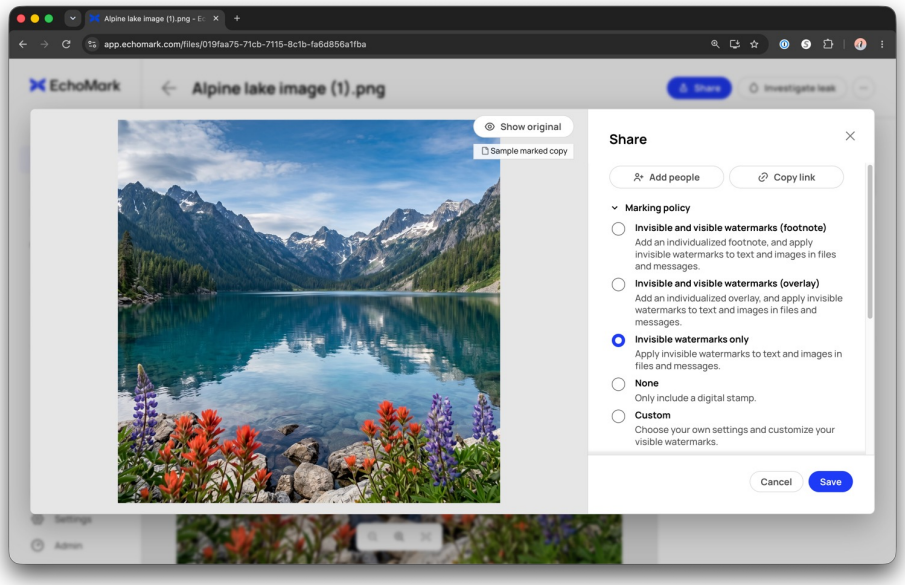
ECHOMARK FILE SHARE

Files leave your control the moment you share them. Deter leaks and trace the ones that happen.

Typically once a file is downloaded, forwarded, or photographed, you lose visibility and traceability. EchoMark File Share gives each recipient a uniquely marked copy, and adds access, download, and analytics controls.

HOW ECHOMARK FILE SHARE WORKS

- Upload a file and share it by secure link or email. Each recipient receives their own forensically marked copy.
- Control downloads, inactive time-out, and link expiration, and revoke access after a file has already been shared.
- Set invisible marks, visible marks, or both. Visible marks indicate to recipients that their copy is traceable to them.
- If the file resurfaces as a photo, printout, or screenshot, EchoMark can identify whose copy leaked.



Share without giving up control

Recipients open a viewer, not a loose attachment. Control downloads, timeouts, and link expiration.

See who viewed it

Analytics show which recipients opened the file, which pages they read, and how long they spent on each.

Share a whole set with one link

Group related files into a collection and share them with one link. Marking, expiration, and access controls apply to every file in it.

BUILT FOR REAL-WORLD ENVIRONMENTS

Third-party sharing

Contractors, vendors, agencies, and press who need the file but not a copy they can pass along.

Pre-release material

Scripts, concept art, product roadmaps, and earnings drafts shared ahead of announcement.

Client deliverables

Pitch decks, diligence packs, and reports that leave your organization and keep circulating.

HOW IT WORKS

01

Watermark

Each recipient's link opens a uniquely watermarked view of the file you shared.

02

Detect

You discover a sensitive file, screenshot, printout, or photo outside your organization.

03

Identify

Upload the leaked artifact to EchoMark to identify whose copy leaked, with a confidence score and chain of custody.
