

GRO-BARK®

CPM® LANDSCAPE STANDARD

Technical Data Sheet

PRODUCT DESCRIPTION

Composted Pine Mulch (CPM®) Landscape Standard (L/S) is a bark product that has been created entirely from waste pine bark generated by sawmills. This product is naturally deep brown in colour and becomes black when wet, so it is an excellent product to complement the deep greens and bright colours found in gardens and decorative plantings.

CPM® L/S is created through a controlled composting process over a 10 month period. It is an all-natural product and does not contain any compost accelerant, such as fertilizer.

TYPICAL ANALYSIS

pH*:	3.5 - 5.0
Moisture Content:	45 - 55%
Organic Matter Content:	40 - 60% by weight (dry)
Size Gradation:	99% ≤ 1"

APPLICATIONS

This product is predominately used as a mulch to provide weed control and preserve moisture in the soil, greatly reducing maintenance time and costs. CPM® L/S also adds aesthetic value by improving the colour and appearance of any residential or commercial landscape project. CPM® L/S should be applied 4" thick to achieve the desired result of weed suppression and moisture retention. Like all organic mulches, CPM® L/S will decompose seasonally and annual top-up is required. This decomposition is considered highly beneficial for the soil and plant ecosystem, as rain or irrigation water carries the decomposed organic matter down to feed both the plants and the soil.
