AUTHENTICATION Tech.

Why This Solution?

TAGIT SecureSeal combines NFC or UHF RFID identification with an independently verifiable proprietary physical security feature, providing additional protection against copied RFID identities.

Key Benefits:

- → Passive NFC or UHF RFID Technology
- → NFC via smartphone or UHF via RFID reader
- → Dual authentication: RFID + proprietary physical verification
- → Dedicated handheld detector verifies the proprietary physical security feature
- → Suitable for authentication and resale ecosystems
- → Compatible with existing RFID workflows
- → Combines digital identification with independent physical verification
- → Tamper-evident design helps deter unauthorised transfer and reuse

The core idea:

1 Identify

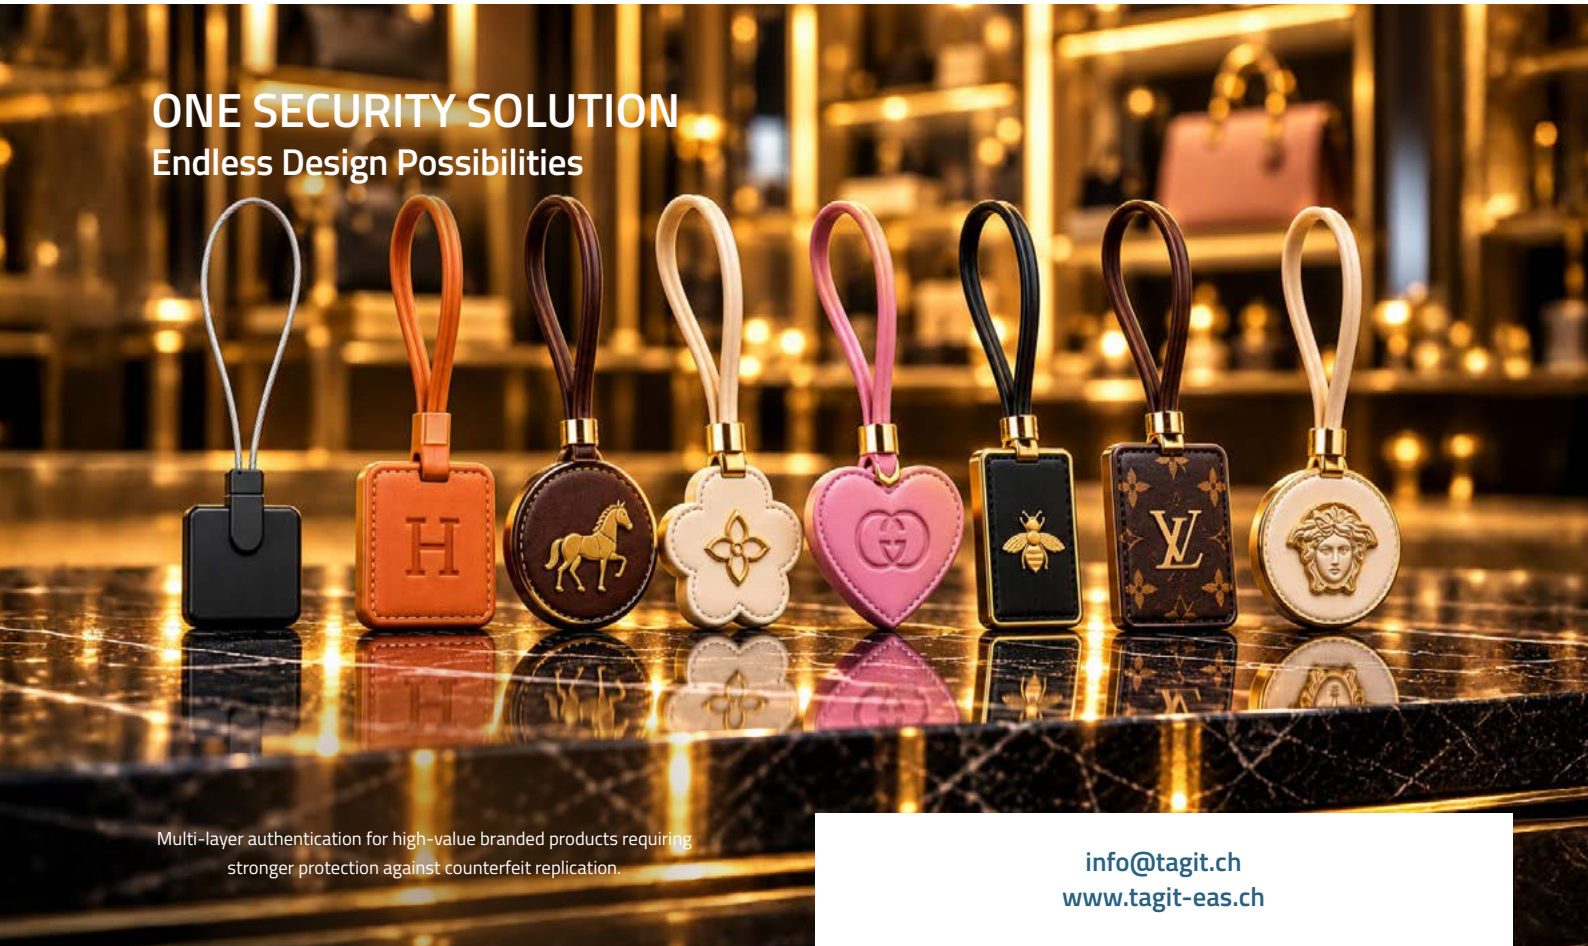

RFID provides the digital product identity, serialization and tracking.

2 Authenticate

A proprietary physical security element provides an independent authentication signature.

3 Verify

The TAGIT handheld detector independently verifies the proprietary physical security feature.

Multi-layer authentication for high-value branded products requiring stronger protection against counterfeit replication.
