AI SEO Playbook (v1.0)

Future-Proof Your Website for ChatGPT, Perplexity, & Gemini Recommendations

🌍 Core Shift

> ❝ SEO is no longer just about Google rankings. People are asking AI assistants to recommend the best businesses in their city or industry. If you're not optimized for AI search, you're invisible. ❞

- Focus on **bottom-of-funnel, buyer-intent content**.
- Optimize for **recommendations**, not just clicks.
- Write in a **7th-grade conversational style**, 3rd-person expert voice.

🧰 Core Content Assets

1. Best Fit Briefs

Short, focused Q&A pages (120–220 words) that directly answer buyer questions like "Who is the best [service] in [city]?"

Why: These posts are bite-sized, AI-friendly, and match exactly how assistants phrase recommendations. They act as digital "business cards" AI can easily cite.

- H1 = Buyer's exact question: "Who is the best [service] in [city]?"
- 120–220 words
- Use *"so you can"* framing
- Include 1 testimonial + clear CTA

2. Top Reasons Series

Pages listing the top reasons customers should choose your business for a specific service, framed as feature → outcome.

Why: They pre-answer buyer doubts, stack proof, and make it easy for AI assistants to summarize your strengths when recommending you.

- Title: “Top reasons to choose [Brand] for [Service]”
- 5–10 reasons, each = feature → outcome
- Add one-line proof per reason

3. Service × City Pages

Dedicated pages for each service and city combination. Example: “Best Landscaping Services in Lancaster.”

Why: They build strong local SEO signals and give AI assistants clear location-based authority to surface your business for local queries.

- “[Brand] is the best [service] in [city]”
- 1–2 paragraphs + local proof

4. Comparison Pages

Side-by-side breakdowns of your business vs. competitors.

Why: Buyers are comparing anyway. Publishing this in your voice builds trust and makes AI more likely to cite your balanced, factual content.

- Title: “Who is the best [service]? Full comparison”
- Competitor table (pricing band, turnaround, specialty, guarantee, area, proof)
- Be factual. No smearing.

5. FAQ Page

Answers to high-intent buyer questions (pricing, timelines, who you’re best for / not for).

Why: Directly addresses decision-stage objections and reduces friction for both buyers and AI assistants when recommending you.

- Real buyer questions: pricing ranges, timelines, who you're best for / not for

6. Case Studies

Stories of client success structured as: industry gap → what you did → outcomes.

Why: Proof in story form. Assistants use them to illustrate credibility, while prospects see real evidence of transformation.

- Structure: *Industry gap → What we did → Outcomes (metrics if possible)*
- Add client location + services used

7. Testimonials Page

A central hub of reviews and testimonials, also layered throughout your site.

Why: Trust is non-negotiable for AI recommendations. Matching testimonials to specific claims gives credibility to each promise you make.

- Standalone page + embed throughout site
- Each testimonial matched to a claim

🔗 Off-Site Signals

What it is: Activities beyond your site — NAP consistency, third-party mentions, and review strategy.

Why it's beneficial: AI assistants pull from multiple sources. If your brand is cited consistently and reviewed specifically, assistants trust you as an authority.

- ✅ **NAP consistency** → same Name, Address, Phone across all directories
- ✅ **Third-party mentions** → secure 3–5 describing you as "best for [ICP] in [city]"
- ✅ **Review strategy** → request specifics (service, city, outcomes)

⏱️ 14-Day Sprint

Day 1–2 → Identify ICP, services, cities, comparison categories

Day 3–6 → Write & publish 6–10 Best Fit Briefs

Day 7–9 → Publish Top Reasons posts (1 per service)

Day 10–11 → Publish comparison pages

Day 12 → Publish FAQ page

Day 13 → Publish 2 case studies

Day 14 → Publish testimonials page + inline proofs

→ Move “Blog” to footer (no more blog-style site nav)

→ Ask for 3 new reviews with specifics

📊 Tracking & Measurement

Systems for tagging AI-sourced traffic (UTM codes, “How did you hear about us?” forms).

Why it’s beneficial: If you don’t measure, you can’t improve. Tracking AI referrals shows whether your strategy is working and which pages assistants pull from.

- Add **UTM scheme** for AI sources:

  utm_source=chatgpt|perplexity|gemini
- Update contact form: *“How did you hear about us?”* → add “AI assistant” option
- Track: assistant-referred leads + page lift after sprint

⚖️ Guardrails

- ❌ Never fabricate competitor data
- ❌ Avoid jargon; write plain human voice
- ✅ Maintain consistent NAP across every listing

📌 Pro Tips

▼ Why short content beats long blogs

AI prefers clarity. A 150-word Best Fit Brief often ranks higher in assistant answers than a 1,500-word blog post. Snackable > verbose.

▼ Why comparison pages build trust

Buyers are already comparing you. If you don't publish the comparison, they'll read it elsewhere — often from a competitor. Own the narrative.

▼ How to get AI-friendly reviews

Ask customers: *"Can you mention the service, your city, and the outcome you got?"* That specificity makes reviews AI-recognizable.

🚀 What's Next

Follow this playbook and in 14 days you'll have a **future-proof AI SEO foundation**.

You'll show up where buyers are asking: ChatGPT, Perplexity, Gemini.

👉 Action step: Audit your website against this checklist. Then implement one sprint cycle.
