FROM THE EDITOR

What makes a future worth living in?

We tend to imagine the future as something new. This issue starts at a workbench, with an object that will not run and a person unwilling to give up on it. The photograph on our cover is an illustration; the question it poses is real.

There is a point in almost every repair where the object stops being the main problem. The drawing is missing, the part is not for sale, or the person with the knowledge is already busy. The thing is on the bench, but the decision about its future may be somewhere else.

That is why a phone, a public budget and a sewing table can belong in the same issue. Each brings a different question about the right to act and the means to follow through. We look at the people who organise those means, from a repair café in Amsterdam to an architect in Pakistan and a scholarship programme in Naples, Florida.

Read this issue in any order. If you start with one object, follow its failure far enough to see the system behind it. If you start with the people, notice what they leave behind that someone else could use. The future is lived in both directions.

03 The Human Detail
Cover story, repair research & the cost test

06 The Desks
AI, arts, business, culture, design, fashion and more

18 Global Signals
Nine shifts to watch, from power grids to access

27 Human Stories
Six stories across six inhabited continents

33 Industry Changemakers
Anne Lacaton, Peter Mui and Muthoni Drummer Queen

36 Company Spotlight
Fairphone and the boundary of modular repair

37 Celebrity Spotlight
NVIDIA's Jensen Huang

38 Public Leadership
Georgia governor-elect Keisha Lance Bottoms

39 Technology & Platforms
Apple repair and Meta Community Notes

41 Community
Habitat for Humanity and the Rotary Club of Naples

43 Style & Design
Menswear, womenswear, architecture and interiors

48 Sources & Notes
Reporting, reader signals and image credits

50 Contact
Editorial, corrections and partnerships

51 The Closing Page
What will you keep working?

THE HUMAN DETAIL / Noir Spider Atelier

The future is lived

A right to repair matters only if the means are within reach.

The choice at the bench

A watch stops. A phone will not charge. A door begins to stick. None of these small failures tells you what should happen next. Before ordering a replacement, you need a diagnosis, a realistic price and confidence that the part and skill exist. The gap between asking those questions and getting the answers is what this issue calls the distance to repair.

What the label leaves out

The Global E-waste Monitor estimated 62 million tonnes of electronic waste in 2022. That is a global waste estimate, not a count of devices someone could have fixed. Its scale matters, but a household encounters it one decision at a time. A part that will arrive next month is not the same as a part you can use before work tomorrow.

A right with conditions

European Union rules promote repair for products within their scope. In the United States, the Federal Trade Commission has examined repair restrictions. These are different policy settings, not interchangeable guarantees. A buyer still needs to know whether the exact model is covered, how to reach a technician and what it will cost to be without the device.

A different kind of return

Value can come from buying less, but it can also come from knowing more. A shop that explains a fault reduces someone’s dependence on guesswork. A company that publishes a usable manual makes support easier to test. A board that listens to an uncomfortable question can prevent a much larger failure later. Each gives someone else a better next move.
