Post-Mission Evaluation Support for Training, Test, Experimentation, and AAR

An evidence-linked first pass for human evaluation of completed events.

COMPANY DATA

UEI: TNUQSL6AP3K1

CAGE: 19P73

NAICS: 541715, 541511, 541512, 541611, 541990

Small Business | Woman-Owned

Coverage: U.S.-Based | Available Nationwide

COMPANY OVERVIEW

After a training event, test, or exercise, teams may have the records but still need to piece together what happened. Field IQ Event Review is software that turns supported completed-event evidence into an evidence-linked first pass. It organizes and connects records so evaluators can inspect the event, trace observations to original sources, and record their own interpretations.

Field IQ supports human judgment without replacing it.

Best-fit environments:

- Training and certification exercises
- Unmanned systems, craft, vehicle, and route-based testing
- Experimentation and test and evaluation environments
- Observer Controller, evaluator, analyst, and post-event review workflows

CORE CAPABILITIES

- **Reconstructs movement paths and event sequences from supported records**
- **Connects review observations to original evidence and identifies missing information**
- **Compares recorded movement with approved routes when available**
- **Enables evaluators to record interpretations, disagreements, revisions, and handoffs**
- **Brings movement, notes, audio, and linked transcripts together in a demonstrated review configuration**

KEY DIFFERENTIATORS

- ✓ **Not AI-driven. By design. Deterministic evidence processing delivers repeatable results without AI-generated interpretations.**
- ✓ **Original evidence remains traceable; evaluators decide what it means.**
- ✓ **Designed to work alongside existing review and reporting systems.**
- ✓ **Local-first, post-mission operation without interfering with live activities.**

RELEVANT BACKGROUND

- Built around a recurring challenge: reconstructing completed events before meaningful evaluation can begin
- TRL 6 prototype with repeatable, source-traceable processing demonstrated on real third-party UAS flight data
- Selected for and participated in Naval Postgraduate School JIFX 27-1, Experiment G-12, November 2026
