

FGI Member Spotlight

October 2026

Inland Tarp & Liner has spent more than 45 years growing from our roots in agricultural tarp fabrication into a custom fabricator serving geosynthetic covering and containment projects across the United States and internationally. Those practical beginnings still shape the way work today: understanding what a project requires in the field and figuring out how to make the finished product work better when it gets there.

Today, we operate facilities in Washington, Ohio, and Texas, with the capacity to fabricate more than 300 million square feet annually. We work with a wide range of geosynthetic materials and project requirements, for large factory-fabricated panels to custom containment systems and specialty applications. Many of these projects begin with a need that cannot be met by a standard size solution.

Factory fabrication is a major part of who we are. Completing more of the work in a controlled environment allows panels to arrive at the jobsite ready for efficient deployment with fewer field seams. Our team also brings years of field experience into the process, connecting decisions made in the factory with what installation crews will encounter in the field. That perspective carries into projects spanning containment, energy, agriculture, civil and industrial sectors.

We have been a member of the **Flexible Geomembrane Institute (FGI)** for 15 years. Our Chief Technical Officer, Ron MacKenzie, currently serves on the FGI Board of Directors and regularly contributes his

experience in geomembrane design, fabrication and installation to industry education and technical discussions.

As an employee-owned company, we value the knowledge that comes from years of doing the work. The FGI provides us a place to contribute that experience alongside other industry experts, learn from one another and help strengthen the technical knowledge and practices that shape the geosynthetics industry.
