

How IRC Section 263(c) Intangible Drilling Costs Shelter Active W-2 Income for Surgeons

An Analytical White Paper Examining the Statutory Mechanics, Direct Working Interest Ownership, and Tax Treatment Considerations for High-Income Physicians, Dentists, Attorneys, and Financial Professionals

Explore Summit Ventures Working Interest Opportunities

Executive Summary

Every tax season, a recurring pattern plays out across operating rooms, dental practices, law firm partnerships, and CPA offices nationwide: a high-earning professional closes out a year of $150,000 to $400,000 or more in combined federal and state income tax liability, having already maximized a 401(k), funded a backdoor Roth IRA, and exhausted the short list of deferral tools available to a W-2 or 1099 earner. The math no longer scales. A $24,500 elective deferral limit, even paired with a $72,000 combined employer-and-employee ceiling under 2026 IRS guidance, barely dents a seven-figure practice income or a surgical group distribution.

This white paper examines a narrower, statutory question that is frequently misunderstood even by sophisticated taxpayers: how does the Internal Revenue Code actually allow a drilling-related deduction to offset active income — the wages, 1099 compensation, and K-1 distributions that make up the bulk of a professional's earnings — rather than merely sheltering other passive gains that most high-income clinicians and advisors do not have in meaningful supply?

IRC Section 263(c)

Governs the **timing and classification** of intangible drilling costs (IDC) — the non-salvageable labor, fuel, chemical, and site-preparation expenses incurred in drilling a well.

IRC Section 469(c)(3)

The **working interest exception** to the passive activity loss rules — the decisive provision that determines whether the IDC deduction can actually reach a surgeon's W-2 income. Applies only when the interest is held directly or through an entity that does not limit the holder's liability.

The single most important concept: Structure determines tax treatment. This distinction is what every physician, dentist, attorney, or financial professional must understand before evaluating any oil and gas participation opportunity.

Why This Issue Matters

For the persona this paper addresses, the problem is not a lack of income. It is a lack of statutory tools that scale with income. Standard deferral vehicles were designed around W-2 employees with moderate, stable compensation — not around professionals billing at partner rates, running surgical practices, or drawing K-1 distributions from a firm. Once the retirement-account ceiling is reached, the remaining options available to most advisors are limited:

Municipal Bonds

Tax-advantaged but yield-constrained, offering limited offset potential for seven-figure earners.

Real Estate Depreciation

Tied to a "real estate professional" hours test that is functionally unavailable to someone working sixty clinical hours a week.

Pooled Alternative Structures

Underlying losses are classified as **passive** and therefore cannot offset active earnings at all — the deduction exists on paper but cannot reach W-2 or 1099 income.

This creates a structural mismatch. A professional earning active income needs a mechanism that produces an **active-income offset**, not a passive one. Most oil and gas participation programs marketed to high-income individuals are structured as limited partnership or LLC membership interests. Under the general rule of IRC Section 469, losses generated inside those entities are classified as passive and can only offset other income classified as passive under the tax code — income that a practicing surgeon or litigating attorney typically does not generate in any meaningful volume.

Understanding why this happens — and what structural conditions change the outcome — is the foundational concept this paper addresses.

Current Context: Why the IDC Deduction Still Matters in 2026

The intangible drilling cost deduction is not a recent development. Its lineage traces to a 1916 Treasury regulation addressing the unique economics of drilling, where a substantial share of well cost has no salvage value and historically justified immediate expensing rather than capitalization. The provision was formally codified as Section 263(c) of the Internal Revenue Code of 1954, and it has remained a stable feature of the Code through every subsequent tax reform cycle, including the Tax Cuts and Jobs Act and the more recent One Big Beautiful Bill Act (OBBBA), signed into law in July 2025.

1916

Origin Year

Treasury regulation first addressing the unique economics of drilling and immediate expensing of non-salvageable costs.

100%

Bonus Depreciation

OBBBA made 100% bonus depreciation under IRC Section 168(k) permanent for qualified property acquired after January 19, 2025.

13.6M

Barrels Per Day

U.S. crude oil production set a new record in 2025, per the U.S. Energy Information Administration.

48%

Permian Share

The Permian Basin alone accounted for roughly 48% of total U.S. crude output in 2025.

That stability matters more now than it has in years. OBBBA made 100 percent bonus depreciation under IRC Section 168(k) permanent for qualified property acquired after January 19, 2025, reversing what had been a scheduled phase-down toward zero. While that change benefits tangible equipment write-offs broadly, it also highlights a point worth understanding on its own terms: the IDC deduction under Section 263(c) was never subject to that phase-down schedule in the first place. It has operated on a first-year expensing basis for decades, independent of the legislative back-and-forth that has periodically reshaped bonus depreciation for other asset categories.

Continued drilling activity across these basins is what generates the intangible costs — labor, fuel, chemicals, site preparation — that Section 263(c) allows an operator or working interest holder to expense.

The Statutory Mechanics in Detail

CORE ANALYSIS

Intangible Drilling Costs — Section 263(c)

Treas. Reg. 1.612-4 permits a taxpayer with an operating or working interest in a well to elect to expense IDC in the year incurred rather than capitalizing those costs over the life of the asset. IDC includes labor, fuel, hauling, chemicals, and site preparation — items with no salvage value once the well is drilled.

Tangible costs — casing, wellhead equipment, and storage tanks — retain salvage value and are instead capitalized and depreciated, typically under a seven-year MACRS schedule per IRC Section 168. Across multiple independent industry and advisory sources, IDC commonly represents somewhere between **60 percent and 85 percent of total well cost**, though the precise split for any specific well is confirmed only through the Authorization for Expenditure (AFE) documentation for that well and depends on well design, depth, and completion method.

No universal percentage applies to every well or every participant's capital, and the actual allocation should always be confirmed through the AFE and the taxpayer's own return preparation.

The Active-Income Offset — Section 469(c)(3)

This is the provision that does the work most marketing material skips past. The general rule under Section 469 classifies losses from activities in which the taxpayer does not materially participate as passive — meaning those losses can generally only offset other income classified as passive under the tax code, not W-2 wages, 1099 compensation, or K-1 guaranteed payments.

Section 469(c)(3)(A) carves out a specific exception: passive activity "shall not include any working interest in any oil or gas property which the taxpayer holds directly or through an entity which does not limit the liability of the taxpayer." **Two conditions must both be true.** First, the position must be an actual working interest, not a royalty or a limited partnership unit. Second, it must be held directly, or through an entity structure — such as a general partnership — that does not shield the holder from liability.

An LLC or limited partnership membership interest, even one holding capital contributed entirely to working interests, forfeits this exception because the entity itself limits liability. When that happens, the losses revert to passive classification regardless of how the underlying asset performed.

A further point distinguishes this exception from the real estate professional rules many CPAs are more familiar with: **Section 469(c)(3) carries no material participation or minimum-hours test.** A surgeon working a seventy-hour clinical week cannot realistically meet the 750-hour threshold required for real estate professional status. The working interest exception does not require it. Eligibility turns on *how the interest is held*, not on how many hours the holder personally works the asset.

Additional Statutory Layers Every Advisor Must Model

1

At-Risk Limitation — IRC Section 465

Even where the passive classification is removed, the deduction is still capped by the taxpayer's at-risk basis under Section 465. At-risk basis generally includes cash contributed and recourse debt for which the taxpayer is personally liable. Nonrecourse financing — a structure common in real estate syndications — does not count toward at-risk basis in the oil and gas context. This means the deduction is tied to real economic exposure rather than financial engineering, a distinction worth understanding when comparing this structure against other alternative asset classes.

2

The AMT Layer — IRC Section 57(a)(2)

Excess intangible drilling costs are treated as a tax preference item for purposes of the alternative minimum tax, but the Code includes two relief mechanisms. Under Section 57(a)(2)(A), the preference applies only to the extent excess IDC exceeds 65 percent of the taxpayer's net income from oil, gas, and geothermal properties for the year. Under Section 57(a)(2)(E), independent producers receive a further exception, though that relief is itself capped so that the AMTI reduction cannot exceed 40 percent of alternative minimum taxable income. The practical consequence: drilling-related deductions generally cannot reduce AMTI below roughly 60 percent of pre-deduction income for an independent producer's excess IDC.

3

Timing — IRC Section 461(h)

The economic performance rule under Section 461(h) limits a taxpayer's ability to prepay IDC late in a calendar year for a well that will not actually spud for months, subject to a narrow exception generally referred to as the 90-day drilling exception. Capital contribution timing relative to spud date is therefore a planning variable, not an afterthought, and should be confirmed in writing before year-end capital is committed.

4

Ongoing Benefit — Percentage Depletion (Sections 611 & 613A)

Once a well reaches production, independent producers may generally claim percentage depletion equal to 15 percent of gross income from the property — a benefit that continues annually as long as the well produces income, independent of the taxpayer's remaining basis in the asset. This converts the Section 263(c) election from a one-time, first-year event into a recurring, multi-year tax treatment consideration tied to actual production income.

What the Statute Does Not Shelter

Professional advisors should also understand the limits of this framework. In *Methvin v. Commissioner* (10th Cir. 2016), the Tenth Circuit addressed self-employment tax exposure for certain working interest holders — a reminder that the 469(c)(3) exception resolves passive-versus-active income tax classification but does not automatically eliminate every other tax consideration tied to direct participation in an operating activity.

Separately, losses are subject to a four-layer limitation sequence before they reach a taxpayer's return: basis limitation, then the at-risk rules under Section 465, then the passive activity rules under Section 469 (which the working interest exception addresses), and finally the excess business loss limitation under Section 461(l), set for 2026 at **$256,000 for single filers** and **$512,000 for married filing jointly**. Each layer is independent, and a capital contribution that clears the 469(c)(3) exception can still be constrained by basis, at-risk, or excess business loss rules depending on the taxpayer's broader return.

How Direct Working Interest Participation Is Structured

Understanding the statute is the first step. The second is understanding what "direct" actually requires in practice — since this is the point where most pooled program structures fail the test described above. A structure designed to preserve the Section 469(c)(3) exception generally needs four elements working together.

Direct Assignment of the Working Interest

Direct assignment to the individual participant — rather than a membership or limited partnership unit in an entity that holds the interest on the participant's behalf. The distinction is not cosmetic. It is the entire basis for whether losses are classified as active or passive under the Code.

AFE-Documented Cost Allocation

AFE-documented cost allocation for each well, so the intangible-versus-tangible split — and therefore the Section 263(c) election amount — is tied to actual, itemized drilling cost documentation rather than an estimated or marketed percentage.

Governance Rights & Operational Transparency

Governance rights and operational transparency that come with holding an actual working interest position — including access to well-level operating data, authorization for expenditure documentation, and the ongoing reporting that distinguishes an entrepreneurial joint venture participant from a silent capital source.

Correct K-1 Reporting

K-1 reporting that reflects the correct active, nonpassive classification under Section 469 for the participant's share of intangible drilling cost deductions, percentage depletion, and ongoing production income — so the position is represented consistently and accurately from the operator's books through to the participant's personal return.

This is the operating model behind Summit Ventures' entrepreneurial joint venture structure: business participants hold an actual working interest position, directly, with governance rights and operational transparency built into the relationship from member onboarding through ongoing reporting, rather than a pooled or liability-limited share in a separate holding vehicle.

Recommendations & Advisor Checklist

A professional evaluating this structure — or a CPA advising one — should treat the following as a working checklist rather than a formality.

Confirm How the Interest Will Be Held

Before any capital contribution is made. A single-sentence answer — direct working interest versus an entity that limits liability — determines whether Section 469(c)(3) applies at all.

Request the AFE for the Specific Well(s)

Rather than relying on an industry-average percentage, since the actual intangible-versus-tangible split drives the first-year deduction calculation.

Model the AMT Exposure Under Section 57(a)(2)

Alongside the base deduction — particularly for independent producer status and the 65 percent and 40 percent thresholds described above — before assuming the full deduction will clear at the margin.

Confirm At-Risk Basis Under Section 465

Reflects actual cash and recourse debt exposure, since this figure — not the gross deduction amount — is the real ceiling on what can be claimed in year one.

Review Capital Contribution Timing

Against the well's anticipated spud date under the Section 461(h) economic performance rule, particularly for year-end commitments.

Treat Percentage Depletion as an Ongoing Planning Item

Under Sections 611 and 613A as a separate, ongoing planning consideration once production begins — not merely a footnote to the first-year IDC deduction.

Confirm K-1 Coding

Reflects active, nonpassive treatment consistent with the working interest structure actually held.

Questions for Professional Advisor Discussion

Before evaluating any specific well-level participation, bring these questions to your CPA or tax attorney:

Question 1

Is the working interest being offered as a direct assignment, or as a membership interest in an LLC or limited partnership that would forfeit the Section 469(c)(3) exception?

Question 2

What does the Authorization for Expenditure show for the specific intangible-versus-tangible cost allocation on this well, rather than an industry-average estimate?

Question 3

How does my current at-risk basis under Section 465 compare to the deduction being modeled, and does nonrecourse financing play any role in the structure?

Question 4

Based on my 2026 projected income, where do the Section 57(a)(2)(A) and (E) AMT thresholds place my actual exposure?

Question 5

Does the timing of my capital contribution align with the well's anticipated spud date under the Section 461(h) economic performance rule?

Question 6

How will percentage depletion under Sections 611 and 613A be reported once the well reaches production, and for how many years is that benefit expected to continue?

Question 7

How will my K-1 reflect active versus passive classification, and who is responsible for confirming that coding is correct?

Question 8

Given my existing basis, at-risk, and excess business loss position under Section 461(l), what portion of a prospective deduction would actually be usable in the current tax year?

Closing Perspective

> The intangible drilling cost deduction under Section 263(c) has been part of the Internal Revenue Code for more than a century, and the working interest exception under Section 469(c)(3) has offered a direct, statutory path for active income offset for decades. Neither provision is a workaround or an aggressive filing position.

Both are documented, well-litigated features of the Code that depend entirely on how an interest is structured and held. For physicians, dentists, attorneys, and the CPAs and financial professionals who advise them, the opportunity is not in discovering something hidden. It is in understanding, precisely, which structural conditions the statute actually requires — and in working with an operating structure built around direct working interest ownership, governance rights, and operational transparency rather than a pooled or liability-limited arrangement that quietly forfeits the exception.

Readers are encouraged to bring the questions above to their own CPA or tax attorney before evaluating any specific well-level participation, and to treat this paper as a starting point for that conversation rather than a substitute for it.
