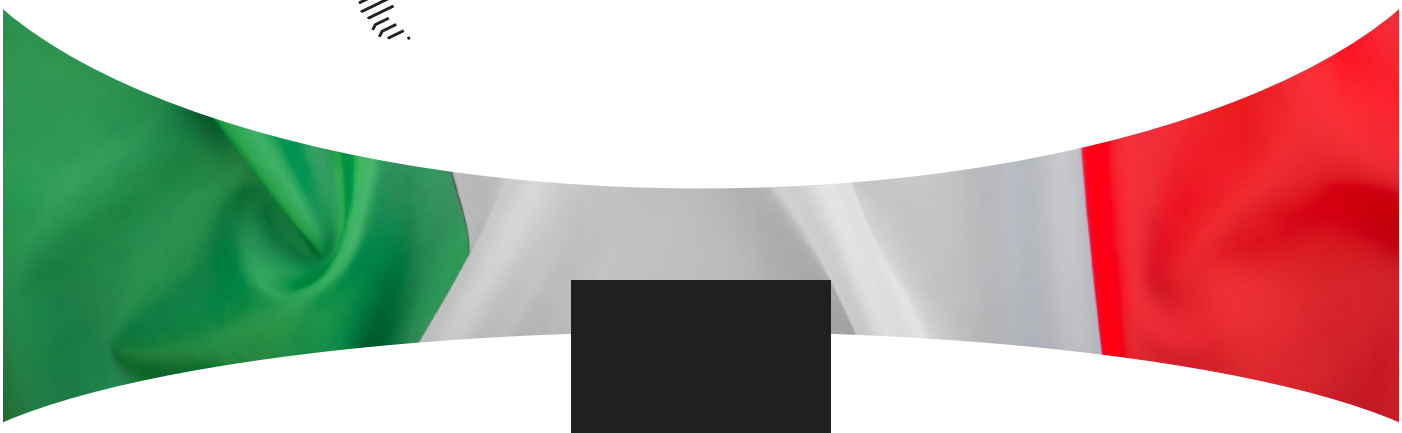
Innovative heating solutions

THE NEW AGE OF FIRE

Made in Italy quality knows no boundaries

Dielle® products are distributed throughout Italy and much of Europe and the world, both through company-owned branches and a dense network of distributors, agents and business partners.

The international approach and the careful study of appropriate solutions for the market of reference, has led over time to the consolidation across borders of the **Dielle®** quality brand, occupying, today, a position of absolute leadership in heating.



THE NEW AGE OF FIRE

AMADA

Dielle® has developed and patented a combustion system that is absolutely unique.
In a Dielle stove, in fact, the pellets are fed into the burner from below by means of stainless steel screws controlled by a microprocessor, which, by means of the forced feed of the material, avoid clogging problems and promote constant and uniform combustion over time.
Thanks to this innovative feeding system, moreover, the feeding of the fuel from below makes it possible to obtain a stable and more natural flame, like that of wood burning.

Patented Pellet Supply System from below

1 \ NATURAL
Dielle's patented combustion system guarantees, with all operating powers, a much more natural flame than with conventional pellet stoves.

2 \ QUIET
Thanks to the special design of the pellet distribution system, the fuel supply is extremely quiet.

3 \ PRACTICAL
The feeding of pellets into the combustion chamber from below causes the natural and automatic expulsion of residual ash, thus enabling minimal maintenance and cleaning.

4 \ ECONOMIC
Dielle's patented combustion system is less sensitive than that of conventional pellet stoves and allows the use of even lower quality pellets.

5 \ EFFECTIVE
During transport to the combustion chamber, the pellets are preheated and dried for optimal combustion.

All Dielle® products are equipped, as standard, with a latest-generation colour touch screen control panel.

This innovative product is equipped with a 4,3" capacitive multi-touch display and an ARM® Cortex®-M7 processor, which allows for excellent definitions and smooth animations. Through intuitive and detailed graphics, the display is able to show the operation of your system, allowing you to manage your stove with ease. The Dielle® Touch Screen is designed to support future updates in firmware architecture and functions.
