How to measure your kitchen

A rough sketch is enough for a free initial estimate. Use inches and round to the nearest inch. If a measurement is hard to reach, leave it blank. CDI will verify the final **measurements on site before we order your cabinetry.**

1 Draw the room from above.

Sketch the walls, including short returns and openings to adjoining rooms. Work clockwise from one corner and write down the full length of each wall, corner to corner.

2 Locate doors and windows.

On each wall, measure from the corner to the outside edge of the trim, across the trim, then to the next corner. Show which way doors swing. Note floor-to-windowsill height.

3 Mark appliances, plumbing and obstacles.

Label the sink, dishwasher, range and refrigerator. Note appliance widths if you know them. Measure from a corner to the sink center. Mark radiators, pipes, posts or soffits.

4 Add ceiling height and photos.

Measure floor to ceiling. If the ceiling steps down, mark where and give both heights. Take a photo of each wall and one from the doorway. Tell us what you hope to change.

Example sketch

View from above

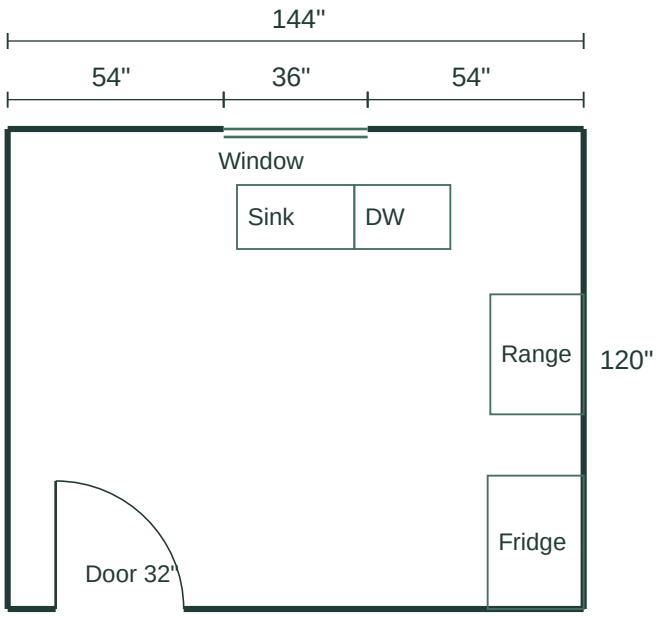
Overall room
144" × 120"

Ceiling 96"

Sill height 40"

Sink center 72" from the left corner

DW = dishwasher



Sketch your kitchen

Use this grid or any piece of paper. A photo of a hand-drawn sketch works just fine.

Name _____ Project town _____

Ceiling height _____ in. Floor to windowsill _____ in.

What would you like to change?
