

Windshield Protection Film Care & Maintenance Guide

EXOSHIELD

Maximize your film's usable lifetime

A few simple habits will help preserve your windshield protection film's clarity, visibility and overall performance.

48H

Let the film cure

Avoid wiper blade use, driving in the rain and car washes for the first 48 hours after installation.

Temporary waterspots or slight visual distortion can be normal while moisture evaporates. **Park in a warm, sunny area to help speed up the curing process.**

Windshield protection film can take up to 14 days to fully cure. During this time, water spots or slight distortion may appear - this is normal and should clear as the film cures.

Simple maintenance, lasting protection.

EXOSHIELD

Keep the film stain-free

Hand wash the film gently with soap and water. It is best to keep a tint safe cleaner, and a clean microfibre in your vehicle to address any bird droppings, oil, sap, dirt or other chemicals that find their way onto the surface of your ExoShield installation.

Check your wiper blades

Windshield wiper blades should be in good condition and free from chips, cracks, or visible damage. Dirt and other road debris can build up under the wiper blades. Keep the wipers clean with a damp microfibre to remove trapped grit that can create micro scratches in the film.

Only use approved coatings

For added hydrophobicity, **an additional ceramic coating can be applied to your ExoShield windshield protection.** For more information and the full list of approved coatings, head to <https://www.getexoshield.com/blog/ceramic-coatings-windshield-protection>

Don't forget to register your warranty.

Your ExoShield purchase includes a limited product warranty lasting up to 3 years, that covers all manufacturer's defects.

In order for you to be eligible to submit a warranty claim, you must register your ExoShield purchase within 30 days of your install and provide your original invoice.
