

Quality Control at Production Scale

Root cause and deviation, connected to the R&D and formulation data that explain them. One record carries it from first test through release, nothing rebuilt from scratch.

Uncountable's AI end-to-end platform is deployed by 175+ teams globally

An out-of-spec batch, and the clock is running

QC data usually lives apart from the formulation, batch, and test data behind it, so investigations become document hunts. SPC happens after the fact, and ERP was never built to capture quality history.

5

labs on one QC LIMS

Lubrizol

25%

more time for experiments

Cibimmob

25%

higher R&D efficiency

BlueNalu

4hrs+

saved per scientist weekly

Ripple Foods

Testing, release, and deviation on one record

QC connected to formulation and batch data

An out-of-spec result is traceable to the exact formulation and batch that produced it.

Root-cause investigation at production scale

The investigation pulls formulation, batch, and lot data into one place.

Live SPC with real-time alerts

Results post to the control chart as they are entered, not on a monthly export.

Deviations that open themselves

An out-of-spec reading can raise an alert and open a deviation automatically.

Audit trails and e-signatures, automatic

Every QC record captures its own audit trail and signature as testing happens.

Release documentation, ready to export

Batch release documentation and QC data export, ready for audits and customer requests.

From out-of-spec reading to released batch

One connected record, from the control chart through investigation to release.

What Sets Uncountable Apart for QC

Quality with its explanation

The event sits beside the R&D and formulation data behind it.

Distinct from the R&D LIMS

Built for repeated, scheduled, workflow-driven testing at production scale.

Failures tracked, not overwritten

Retests keep their history instead of replacing the original value.

Certificates of analysis templated

Auto-populated from qualified test data at batch release.

Connects Across Your Stack

A deviation never has to be traced by hand across systems.

The investigation never starts from zero, formulation, batch and lot data are already attached.

See It on Your Own Line
