

FLYBUSTER®

WHAT IS IT?

FLYBUSTER® is a pesticide free, animal protein free, effective, eco-friendly bait system that attracts and traps flies.

- Safe in many agricultural contexts to help reduce the spread of diseases, and aggravation that comes from flies.
- The one-way trap bucket allows flies to enter but not escape.
- When water is added, the bait emits a smell to attract flies.
- The bait is rich in proteins to encourage flies to lay eggs inside the trap, thus breaking the fly reproduction cycle.
- **Suitable for all types of livestock farming operations.**

HOW CAN IT HELP YOU?

Dairy, Beef Cattle & Sheep:

- Reduces the risk of fly-borne disease.
- Increase production efficiency.
- Assists with preventing fly-strike in the feedlot.
- Improves staff working environment.

Horses:

- Minimise aggravation and stress to both horses and handlers.
- Helps to reduce fly-related eye irritation in horses.

MILNE Feeds

FLYBUSTER® was originally developed in Israel, where intensive farming operations, in close proximity to human populations, led to the development of a fly management system that was not only effective, but easy and safe to use.

The plant-based bait used in **FLYBUSTER®** ensures no foreign pathogens are brought on to the farm, whilst the one-way trap means there is no need for pesticides or poisons – the flies simply drown in the liquid.

The smell, warmth, moisture, CO₂, and protein contained in the trap mimic animal attractants and draw flies away from livestock and into the trap. Once inside, flies lay eggs and die, thus breaking the breeding cycle. As the fly bait is plant-based, it can easily be disposed of in the compost, green-waste or manure pile.

HOW IT WORKS

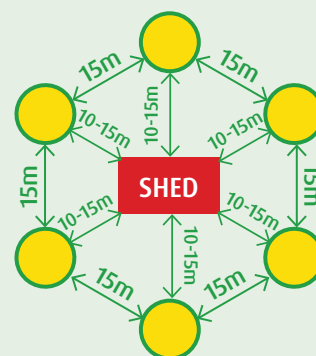

- The one-way trap allows flies to enter, but not escape.
- The bait attracts flies, drawing them away from livestock due to its strong smell and ample food (protein) source.
- Flies enter the trap, lay eggs and drown.
- The traps form a barrier to keep flies away from livestock.
- Once full, the fly trap contents can be emptied into compost or green-waste piles.

HOW TO USE FLYBUSTER®

1. In a 10L trap bucket, mix 250g of bait into 5L litres of warm/tepid water. Stir to ensure bait is dispersed in the water.
2. Allow 24 hours for the bait to activate.
3. Place traps approx. 15 metres apart above ground level around sheds, feedlots, dairies, or 'hot spots'.
4. Check traps and top up with water and remove flies as needed. Adequate water level and removal/sieving flies out is important for full function.
5. Empty trap and refill bait every 4 weeks, or when full.

NB: If the traps are allowed to dry out completely the yeast will die, and the traps will lose their fly-attractant function.

Each trap has a capacity of three million flies, making it perfect for agricultural areas with major fly infestations. The **FLYBUSTER®** system provides a long-term solution for significant fly reduction. It is cost effective, requires little maintenance and is safe to handle.

Place 1.5m
above ground
