

EARTH and SPACE – Knowledge Organiser Year 5 Autumn 1

Vocabulary		What is the Moon?	Movement of the Sun, Earth and Moon
Sun	The star at the centre of our solar system.	The Moon is a large ball of rock that orbits the Earth. It is believed that the Moon was created 4.5 billion years ago when a large planet-sized object collided with the Earth.  The surface of the Moon is covered with craters. These are the result of meteorites colliding with the Moon. The impact of these collisions leaves a large dent in the surface of the Moon known as a crater.  The Moon is the second brightest object in the sky after the Sun but it doesn't shine with its own light: it reflects the light from the Sun. As the Moon orbits the Earth, the Sun lights up different parts of its surface. We	- The Earth takes 24 hours (1 day) to rotate once on its axis. - The Earth takes 365 $\frac{1}{4}$ days (1 year) to orbit the Sun. - The Moon takes 28 days to orbit the Earth.  <u>Day and Night</u> The Earth rotates anti-clockwise on its axis once every 24 hours. At any one time, half of the Earth is in darkness (night-time) and the other half is in light (daytime). As the Earth rotates, it appears that the Sun moves across the sky, with the Sun rising in the East and setting in the
solar	Relating to ('to do with') the Sun.		
Earth	The fifth largest planet in our solar system and the only one thought to have humans living on it.		
Moon	A natural satellite of the Earth made of rock.		
lunar	Relating to ('to do with') the Moon.		
crater	A large dent/hole in the surface caused by something hitting it or by an explosion.		
sphere	A 3D shape (the shape of a globe or football).		
spherical	Having the shape of a sphere.		
disc	A flat 2D circular shape.		
circumnavigate	To completely travel around the globe (usually associated with sea travel).		
gravity	A force pulling two objects towards each other.		
orbit	The curved path through which objects in space move around a planet or star.		
rotate	To turn around a point or axis.		
axis	An imaginary line around which an object rotates.		
day	The time taken for a planet to rotate once on its axis (for Earth this is 24 hours).		
year	The time taken for a planet to orbit the Sun (for Earth this is 365 $\frac{1}{4}$ days).		
lunar month	The time taken for the Moon to orbit the Earth (28 days).		
phase	The Moon's apparent 'shape' created by the Sun lighting up different parts of the lunar surface.		

Northampton Primary Academy Trust Science Knowledge Organiser

horizon	The line at which the Earth's surface and the sky appear to meet.	see the part of the moon that is lit up by the Sun.	West; but it is the Earth which is moving, not the Sun.
