ANALYSIS:

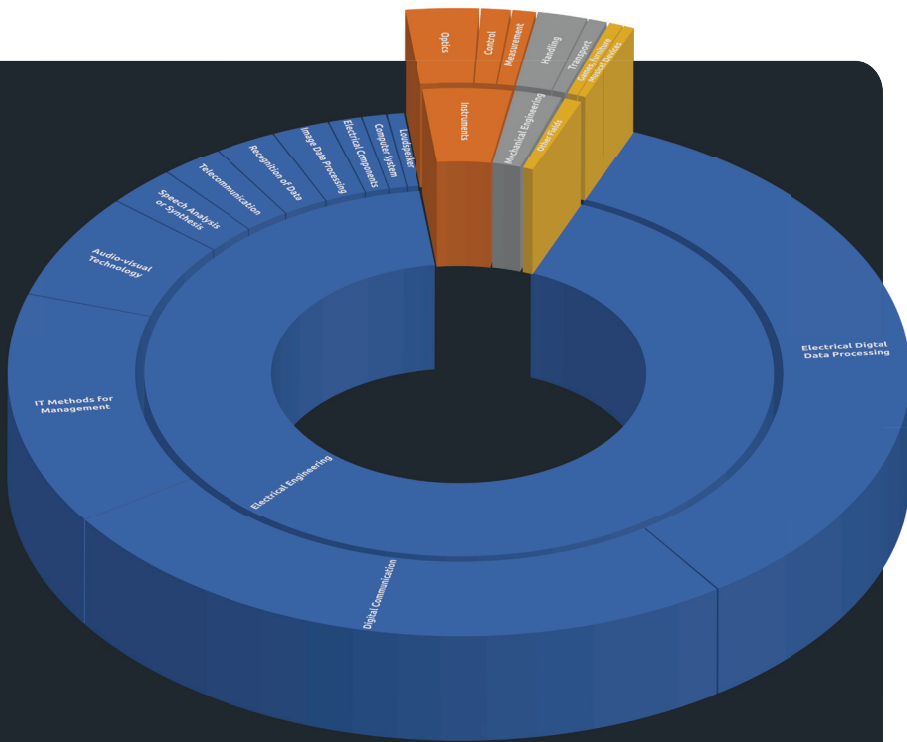

Amazon's portfolio is almost exclusively focused on patents in the electrical engineering sector.

Data processing and digital communication are the two fields driving recent growth in the Amazon portfolio, but they are also patenting in loudspeakers and speech recognition to support Alexa.

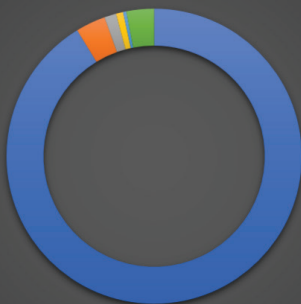

Almost all of top inventors at Amazon have been with the company for an extended period of time demonstrating stability within the corporation.

Amazon has made a few small acquisitions that have involved patents, but for the most part their portfolio is organically grown.

They tend to cite their own patents more frequently than others do, but there has still been interest from Apple, Facebook, Google, IBM, and Microsoft.
