

Fault Location Detection and Classification

About the Presenters

- Name: Nur'ain Areff
- Role: Consultant – Software Engineering
- Education: BSc (Eng) Electrical Engineering & Biomedical Engineering
- Interests: Computer Vision, Software Engineering. Hardware

- Name: Enzo du Plessis
- Role: Consultant – Software Engineering
- Education: BSc (Eng) Mechanical Engineering
- Interests: AI, Control Systems, Automotive Engineering

Optinum is a high-tech consulting and engineering firm with 30+ engineers and developers, specialising in **Artificial Intelligence, Model Operations, and Engineered Systems.**

- Trusted MathWorks partner since 1992
- Original developers of MathWorks' Industrial Communication Toolbox
- Successfully delivered more than 250 projects locally and internationally
- 30+ years in business delivering technical solutions
- Deep experience navigating complexity, and we are good at "blue sky"

Our Competencies

Artificial Intelligence

- Computer vision for hazardous environments
- Generative AI for marketing
- Behavioural modelling in finance and telecoms
- Camouflage testing

Model Operations

- Real-time credit decisioning engine
- Continuous calculation engine for process analytics
- Process hazard identification
- Embedded software for a medical imaging device

Engineered Systems

- Digital mine simulator for manager training
- Autonomous vehicles for deformable terrains
- AUTOSAR algorithm implementation

Agenda

- Problem Statement
- Real-World Example
- Injecting faults into a IEEE 123 Node Test Feeder model
- Classification Algorithm
- Interpreting and displaying data from AI model
- Q&A

Problem Statement

- Can data-driven techniques be used to generate a classification algorithm for fault location detection on a power system, using only a limited number of voltage and current measurements?

Real World Example

- One undetected fault caused one of the deadliest wildfires in California history

Lives lost
85

Damage Cost
\$16.65B

Cause
Single worn hook

- A worn hook arcing against the tower produces a distinct high-impedance ground-fault waveform. A trained classifier flags this
- Correctly identifying it as a single line-to-ground fault, not a transient or load event, tells protection systems to act rather than ride through it

IEEE 123 Node Test Feeder

- Distribution test system to evaluate:
 - Power flow algorithms,
 - Unbalanced three-phase systems
 - Smart grid operations

[Programmatically build network](#)

Three-phase Buses

- 70 Buses
- 7 fault sequences per bus
- Heavy motors in industrial factories

Two-phase Buses

- 3 buses
- 3 fault sequences per bus
- Stoves and appliances in North America

Single-phase Buses

- 55 buses
- 1 fault sequence per bus
- Common in offices and houses

Different Types of Faults

Build Circuits and Inject Faults

Classification Algorithm

- Why is this important?
 - Equipment lifecycle benefit to being able to classify faults early and accurately
 - Assess the working condition of machinery, estimate a likely occurrence of next equipment failure
 - Could potentially save surrounding areas and human or animal lives as alluded to earlier with the California wildfires
- Approach:

Data Collection

- Bus 13
- Voltage and Current readings
- 12 simulations of data
- Package into a Table (6660 x 13)

Data Preparation

- Select unique fault categories
- Index into data
- Create new Table

Classification Learner App

- Load in new Table
- Set aside a test dataset (if applicable)
- Train on available models

Displaying Data from Classifiers

- Confusion Matrix

True Class \ Predicted Class	CB3g8 _b cg	CB3g8 _b g	CB3g8 _c g	CB3g9 _a bcbg	CB3g9 _a cg	CB3g9 _a g	CB3g9 _b cg	CB3g9 _b g	CB3g9 _c g
CB3g8 _b cg	2								
CB3g8 _b g		3	1						
CB3g8 _c g			3						
CB3g9 _a bcbg				3					
CB3g9 _a cg					7				
CB3g9 _a g						1			
CB3g9 _b cg							1		
CB3g9 _b g								2	
CB3g9 _c g									3

- Training and Validation Metrics

Models		
Sort by	Model Number	
★ 1 Tree	Accuracy (Validation): 94.1%	
Last change: Fine Tree	4/4 features	
★ 2.1 Tree	Accuracy (Validation): 94.1%	
Last change: Fine Tree	4/4 features	
★ 2.2 Tree	Accuracy (Validation): 94.1%	
Last change: Medium Tree	4/4 features	
★ 2.3 Tree	Accuracy (Validation): 94.1%	
Last change: Coarse Tree	4/4 features	
★ 2.4 Linear Dis...	Accuracy (Validation): 97.8%	
Last change: Linear Discriminant	4/4 features
