

# Identity Intelligence + Identity Security Agents

See. Understand. Act.

## Identity environments have outgrown the human operating model.

Lumos Identity Intelligence is the only platform that delivers visibility, intelligence, and agentic action in a single loop, so security teams can stop managing identity risk manually and start closing it at scale.

### Identity Governance Fails at Scale

Identity environments are growing faster than human teams can realistically manage. Every new SaaS app, AI tool, role change, and automated workflow adds identities, entitlements, and credentials to an environment already too complex to track manually. The result is a scale problem the human operating model was never designed to handle.

Current identity governance tools, even those offering better visibility, were not built for this environment. They cannot act on intelligence at scale.

**This creates two major gaps:**

#### The Intelligence Gap

Risk signals like stale entitlements, orphaned accounts, and terminated credentials exist in identity data, but connecting them into a coherent, prioritized picture requires analysis that takes too long to be actionable. Teams are reactive by default.

#### The Action Gap

Even when a risk is identified, resolving it requires manual investigation, cross-team coordination, and approval chains. The distance between "confirmed problem" and "fixed" is measured in days and weeks, not minutes - if the fix happens at all.

### The Solution: Identity Intelligence + Identity Security Agents

Lumos Identity Intelligence combines three capabilities that have never existed together on a single platform:

#### Identity Visibility

Fine-grained visibility into all identity types - human, non-human, and AI agents. Access graphs across every app and directory, normalized into a single view.

#### Agentic Workflows

Identity Security Agents that can act on what intelligence surfaces. Agents investigate findings, execute remediation, and improve through feedback, closing the loop from insight to action without requiring a human in every step.

#### AI-Powered Intelligence

Continuous, correlated analysis that surfaces what matters, ranked by actual risk. Identity Intelligence gives you the reasoning and the priority.

## How the Agents Work

Security agents are not configured once and forgotten. The model is deliberate:

### Assign, Review, and Improve

Assign agents to jobs with natural-language instructions. Review output, give feedback, and calibrate in a single session - your environment's exceptions and priorities learned on day one.

### Built for Trust, Not Configuration

Agents surface findings before acting. The model builds trust progressively: start with full oversight, then delegate broader remediation as confidence grows. Every dismissed or actioned finding becomes a learning automatically.

## Use Cases

### Reduce Overprovisioned Access at Scale

Agents continuously identify and remediate excess entitlements, not once a quarter or only during a manual review cycle.

### Prevent Incidents Before They Happen

Continuous intelligence paired with agentic action means anomalous access is flagged and addressed before it becomes a breach, not after.

### Eliminate Blind Spots

Surface service accounts, orphaned credentials, and AI agent identities that legacy governance tools cannot see.

## Why Lumos

### Only Closed-Loop IVIP

Visibility-only tools expose the problem and stop. Traditional IGA starts from incomplete data. Lumos closes the full loop from insight to remediation on a single platform.

### Human, NHI, and AI Coverage

Unified visibility across human, NHI, and AI agent identities, not just the human or machine identities legacy tools were built to govern.

### Fast Agent Calibration

Agents learn your environment's exceptions and priorities in a single session. Calibration in one sitting, not weeks of configuration.

## Ready to close the loop?

Lumos Identity Intelligence is available now.  
Security Agents are available via waitlist.

Lumos is the first autonomous identity platform. It automatically discovers and manages access across all your apps. Instead of being overwhelmed by the sprawl of apps and access, Lumos empowers organizations with one unified solution that controls access on auto-pilot. Lumos customers can enhance security, cut software spend and boost employee productivity – all in one platform. Trusted by hundreds of companies, Lumos powers millions of access requests across global companies.
