ematiq career

WE ARE LOOKING FOR

Security Engineer (Platform / DevSecOps)

At Ematiq, we build high-performance, real-time systems for trading across global platforms. Our know-how, data and capital are worth protecting.

Join our small security team as a hands-on engineer. You will build security into our cloud platform and company systems: guardrails as code, identity and access, vulnerability management, detection. Pragmatic and risk-driven, no checkbox security.

What you'll do

- Build and run security tooling and automation.
- Implement guardrails and least-privilege access across AWS and SaaS.
- Run vulnerability management and supply-chain security.
- Harden access to our most sensitive data.
- Respond to security incidents.
- You'll help to both shape and execute on our cybersecurity strategy.

What we're looking for

- 3+ years in DevOps, platform, cloud or security engineering.
- AWS, Kubernetes, Terraform, CI/CD.
- IAM, SSO, secrets management, vulnerability scanning.
- Python or Bash; you automate instead of clicking.
- Clear writing and risk-based thinking.
- Perfect knowledge of network architecture.

Nice to have: AWS Security Specialty / CKS / OSCP / ..., detection & response, fintech or crypto background.
