

Introducing:

COMET Signals 2.0

Redefining artificial intelligence for HSEQ

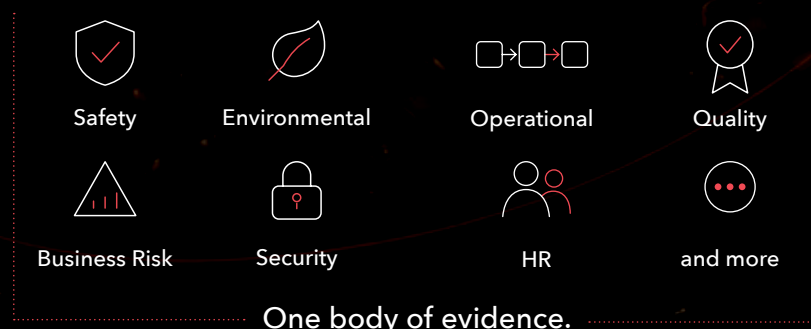

**Your data holds more than one story.
COMET Signals reveals them all.**

COMET Signals is an intelligence layer that sits above the HSEQ systems you already run. Your incident, audit, inspection, quality, environmental and risk systems continue to operate as they do today, without disruption to live operations.

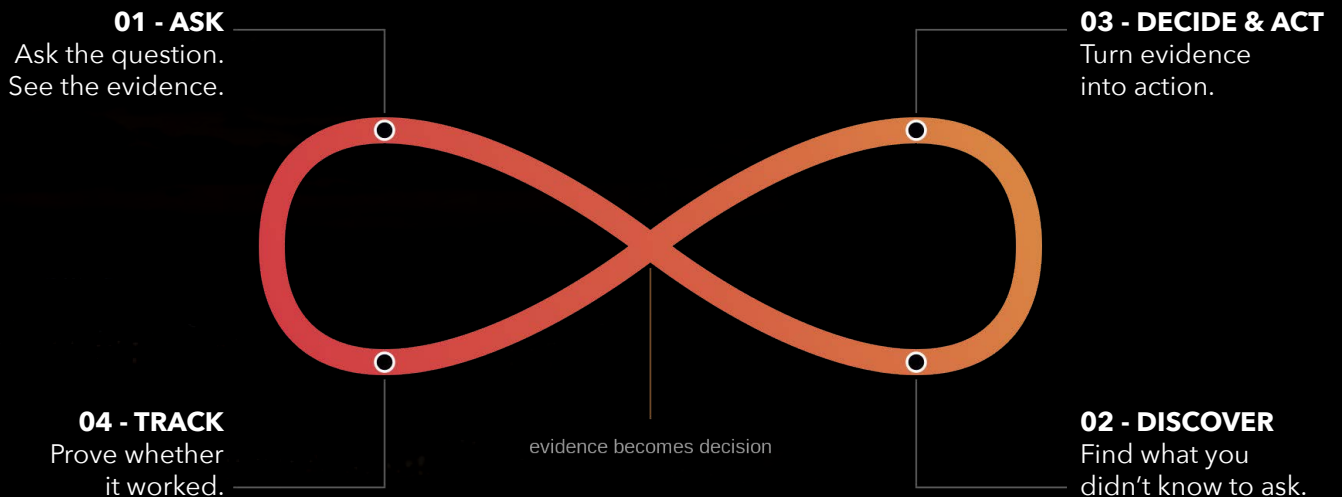

No migration. No change to how your teams record their work.

COMET Signals works continuously across them, building a living body of evidence that grows as your operation does. Question it, explore it and act on what it reveals.

The answer is already in your data.
We close the loop to it.

From question to action to proof

Questions anyone can ask. Answers they can act on.
Actions someone owns. Evidence that shows whether they worked.

Built differently

Everything COMET Signals 2.0 does rests on three convictions.

01

Meaning, not just metrics

Ask questions of your operational data, not just dashboard counts.

02

Configuration, not code

Adapt taxonomies, terminology, agents and analytical skills without development.

03

Confidence is a feature

Every answer shows its working and identifies when evidence is thin.

Built for high-risk operations

Aviation

Energy

Maritime

Rail

Construction

Utilities

Built for the security review

Azure-native | DPIA assessed | ISO 42001 aligned | Personal data redacted | Tenant isolated

See COMET Signals 2.0 in action

Turn the QHSE data you already own into decisions you can act on, actions you can track and outcomes you can prove.

Built and available now. Deployed in days rather than months.
