

Boost Growth and Yield for Potatoes

Algasoil

is a granulated biostimulant derived from seaweed extract, especially recommended for use in potatoes.

Preparation:

Mix with other granular fertilizers:

In a container, mix Algasoil with your regular or preferred granular fertilizer.

Add 1 lb of Algasoil for every 10 lbs of granular fertilizer to the container and mix using a mixer.

Continue mixing until you obtain a homogeneous mixture.

Do not use water or any other liquid substance during preparation.

You can use the mixture immediately once it is prepared.

If you need to stop the application, avoid exposing the mixture to moisture or air while you continue with the application.

Once the mixture is prepared, use it as soon as possible.

Ready-to-use:

Once you open the Algasoil package, you can use it immediately in the field or deposit the contents in a container that facilitates its application.

Do not mix with water or liquid substances.

Do not expose the product to moisture or air.

If there is any product left over, close the package or container to prevent exposure to moisture.

How to use Algasoil

Mix with other granular fertilizers:

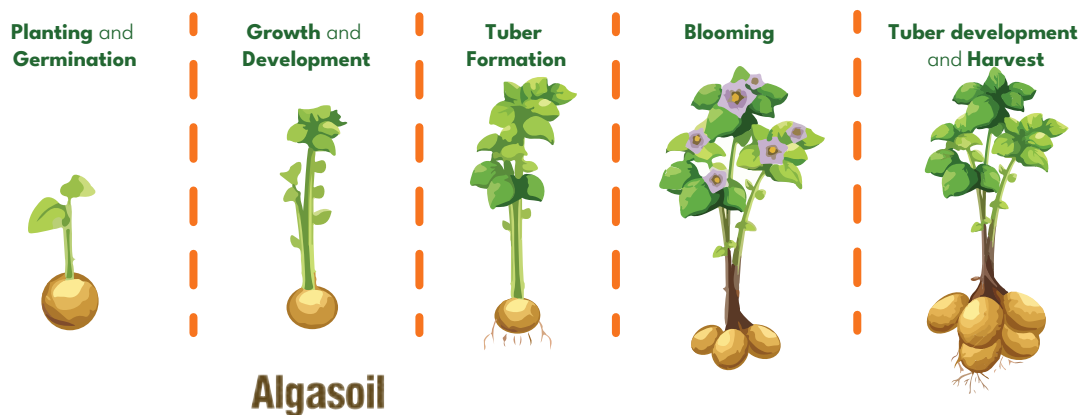

1. Use the same amount of the mixture you usually use, or follow the fertilizer company's guidelines.
2. Spread the mixture evenly in a circular pattern around the plant. Avoid applying against the base of the stem.
3. Cover the mixture with the same substrate or soil as the plant.
4. Abundantly moisten the substrate to initiate the release of nutrients and promote absorption by the plant's roots.

Ready-to-use:

1. Use one 44-pound bag per acre. For garden use, apply 1/4 ounce per plant.
2. Spread Algasoil evenly in a circular pattern around the plant. Avoid applying against the base of the stem.
3. Cover Algasoil with the same substrate or soil as the plant.
4. Water thoroughly to initiate product release.

When to use Algasoil

Algasoil can be used at any stage of the crop, but it is recommended for use at planting or transplanting to promote root development. In established crops, use every 4 months.
