

NOVAGRA INCORPORATED

Farming With Nature

Balance of nutrients Placement of fertilizer Timing of application

THE NOVAGRA PROGRAM

RECOMMENDED FOLIAR APPLICATION:

Make this foliar application when alfalfa plants are showing about 2 to 4 inches of regrowth after cutting. Foliar applications at these times will yield best results. Apply in 15 to 30 gallons per acre total volume.

3 GALLONS DIFOLIAR BLEND 1 PINT NOVAMIX-32

NOTE: With new stands, make the fall application well before the first killing frost. In older established stands, make the fall application well before going dormant.

NOTE: Crops under moisture stress do not respond well to foliar applications of fertilizers. Best results will be realized by making foliar applications in early morning or late afternoon/evening hours.
