

Rapid Delivery for Lean Multi-Functional Salesforce Teams

The Challenge

AI is accelerating Salesforce development, but most AI solutions lack the context of how work actually gets delivered. They operate outside the DevOps lifecycle, without visibility into your org structure, dependencies, environments, or release processes.

As a result, teams are left with AI-generated outputs that aren't fully validated, governed, or production-ready.

At the same time, lean Salesforce teams are stuck between manual change sets and overly complex DevOps tools. Testing remains disconnected from the pipeline, AI is not embedded into workflows, and there's limited visibility into change impact.

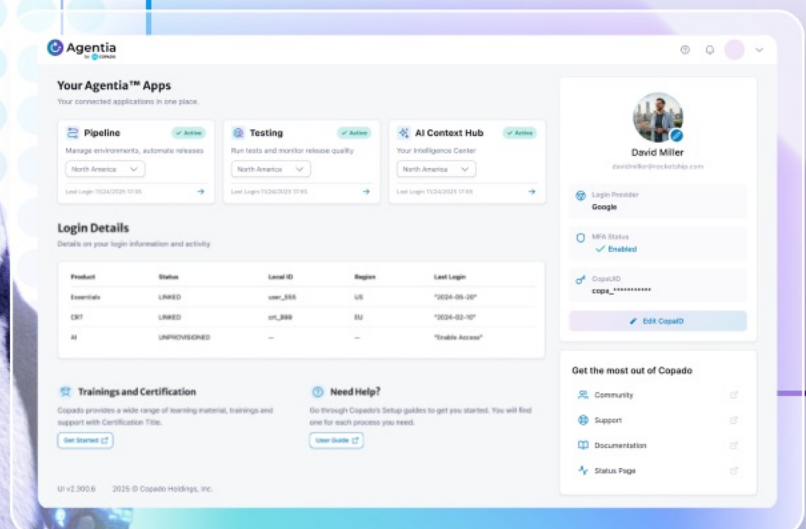

The result: slower releases, reactive troubleshooting, and increased delivery risk.

The Solution

Agentia Advanced changes this by **embedding context-aware agents into the workflow**, where work actually happens. Built on over 15 years of Copado DevOps data and purpose-designed for Salesforce, Agentia Advanced delivers AI that understands your org's metadata, business processes, and integrations.

By unifying Agentia Pipeline, Agentia Testing, and Agentia AI Context Hub into a single platform, it brings testing into the pipeline and AI into the workflows. Our agents are not standalone assistants; they guide decisions, generate components, tests, and documentation, orchestrate deployments, and accelerate troubleshooting, all within governed, production-ready processes.

The result is a fully unified delivery experience for lean-multifunctional teams where every change is validated, traceable, and aligned to real-world Salesforce complexity, enabling faster, higher-quality releases and improved collaboration across roles.

Key Use Cases

Accelerate High-Quality Releases

Teams can initiate delivery directly from structured work items. The agents can analyze business requirements, generate the necessary Salesforce components, and guide validation and deployment decisions, while creating release notes and relevant documentation.

Eliminate Testing Bottlenecks

Integrated functional and robotic testing enables automated regression validation with every promotion. Test scripts are generated directly from business requirements, increasing coverage while reducing manual testing cycles.

Intelligent Issue Rapid Resolution

Using deep org intelligence and dependency analysis, the platform quickly identifies the root cause of delivery issues and provides actionable guidance. This enables teams to resolve deployment failures in minutes with rollback capabilities.

Coordinated Multi-Functional Collaboration

Developers, admins, and business stakeholders work within a shared delivery process. Automated conflict detection, change versioning, and lifecycle visibility help teams collaborate more effectively and reduce the risk of overwriting changes.

Ideal For

Agentia Advanced is designed for Salesforce teams that:

- ✓ Coordinate lean teams across one primary production org
- ✓ Require faster release cycles without compromising quality
- ✓ Want to reduce manual deployment and testing effort
- ✓ Need improved visibility into changes and environment status
- ✓ Are ready to adopt AI-assisted delivery practices
