

Acronis Backup for RushFiles

RushFiles can be extended with backup from Acronis.

Backup is available only in combination with RushFiles. It is not offered or used as a standalone service.

OVERVIEW

This backup service provides backup and recovery as an additional protection layer alongside RushFiles.

Backup creates recoverable copies of data that are stored separately from live file access. These copies are used when data needs to be restored after incidents such as data loss, corruption, or security events. Backup does not affect how files are accessed, shared, or worked with in RushFiles.

HOW IT WORKS WITH RUSHFILES

RushFiles is used for daily file access, sync, and collaboration.

Backup operates separately and is accessed only when recovery is required. It does not interfere with normal file usage and is not part of everyday workflows. File sharing and backup serve different purposes and are used at different times.

WHAT IT PROTECTS

Backup is used when recovery is required beyond individual file actions, for example:

- recovery after major data loss or security incidents
- protection of server- or storage-level data
- retention or compliance requirements
- recovery of larger data sets

Backup covers these scenarios without changing how files are used day to day.

CAPABILITIES

Encrypted backup storage

Recovery data is encrypted within the backup layer.

Independent recovery layer

Backup provides recovery from data loss scenarios beyond live file access.

Policy-based retention

Backup data is retained according to defined retention rules.

WHEN BACKUP BECOMES RELEVANT

Backup is typically introduced when recovery requirements extend beyond daily file usage.

This may occur after security reviews, compliance assessments, or when there is a need to recover larger data sets or systems after incidents. In these cases, backup is added as an additional recovery layer without changing how RushFiles is used.
