

Geofencing with Tended

Geofencing technology is being used for your safety on this worksite.

Geofencing creates virtual boundaries around a specific geographical area. On the railway, geofencing can be used to mark safe zones around worksite limits.

Tended devices are attached to track workers and/or assets within your worksite, the device will quickly alert the user if it exits the safe zone boundaries notifying the user to return to within the worksite limits.

Devices are attached to assets in Asset mode, meaning their live location is reported to the Dashboard for the ES to monitor. Devices assigned to individuals in Wearable mode, so their location is never visible in the Dashboard.
