RE: Recycled Content Statement for Metal Components and Polyurethane Belts

Dear BRECOflex Customer,

Our metal components, including pulleys, clamps, and other metal parts, are manufactured from high-quality alloys such as aluminum, steel, and stainless steel. These materials are sourced to meet strict mechanical and chemical specifications, which means they are generally not certified as recycled content. However, metals like aluminum and steel are inherently recyclable, and depending on the supply chain, they may contain some recycled content, though we do not currently certify this.

For our polyurethane belts, while the raw material is not sourced as recycled polyurethane, our manufacturing process incorporates sustainability practices. We **reuse polyurethane byproducts generated during production**, and depending on the specific product, the recycled content can be **up to 50%**. This approach reduces waste and supports resource efficiency.

Best regards,

Paula Newberry
President
