### Ingest and Standardize

Joining data from multiple sources. Our proprietary algorithms include machine learning and natural language processing to transform data or text from any source into OMOP with over 99% reliability. Piano is the only product to automatically maintain your data with terminology updates.

### Governance and Security

Our data warehousing is purpose built for healthcare interoperability. Transformed data is organised, de-identified, and appropriately governed and secured to run applications, at scale. It enforces and audits data access permissions and can be controlled directly and immediately by hospital administrators.

### Analyse

Designed for use by clinicians and researchers, our code free, self-serve analytics toolbox enables insights and evidence to be extracted from the data with ease. A RESTful API provides flexibility by allowing any third party tool to be integrated.

### Federated Analytics

EvidenceHub is our global research collaboration and translation platform enabling real time replication without sharing data. Keep data local to each institution and combine aggregate data for federated analytics.
