

Relevant Case Study

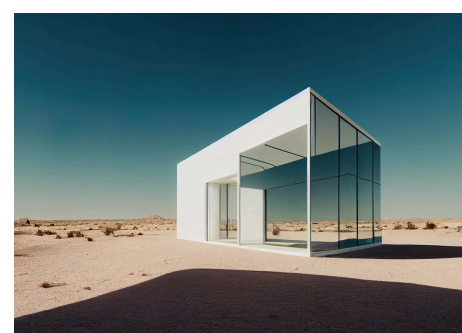

PROBIS AI Labs is the intelligence layer on top of PROBIS, creating customer-specific AI use cases, agents, and satellite products for financial steering of complex construction, infrastructure, and real estate portfolios applying intelligence to budgets, forecasts, cash flows, procurement, change orders, invoices, risks, and benchmarks. The key advantage is that PROBIS AI agents can act on real cost logic instead of interpreting isolated documents.

A multi-billion-euro infrastructure owner managing dozens of concurrent capital projects needed cut-off-date commercial reports at any reference date structured along its own dimensions (asset, region, funding source, project phase) without a controller manually rebuilding the report from scratch each cycle.

Because its project and portfolio structure already lived in PROBIS as governed, structured data, PROBIS AI Report Builder does not need to interpret static spreadsheets or scattered documents it queried the same real cost logic already driving the organization's budgeting, procurement, and invoice verification. For example a report that previously took a controller 8 hours to assemble now regenerates in minutes.

The result: reporting that once required a manual pull from multiple systems now regenerates on demand, in the exact format each steering committee already expects refreshing automatically every time a new invoice, budget change, or approval hits the platform.
