# Key Advantages

- Secure external file sharing from SharePoint, OneDrive, Teams and Outlook
- Branded recipient web portal for external sharing, preventing recipient link blocking
- Eliminates the need for third-party file-sharing solutions, saving millions
- Enables external link-sharing from closed M365 tenants
- Continuous controls prevent oversharing at the time of sharing and data access
- Eliminates guest account management and the associated friction
- Auto-converts email attachments to secure links
- Delivers governance guardrails without compromising productivity or security

Secure External File Sharing from M365

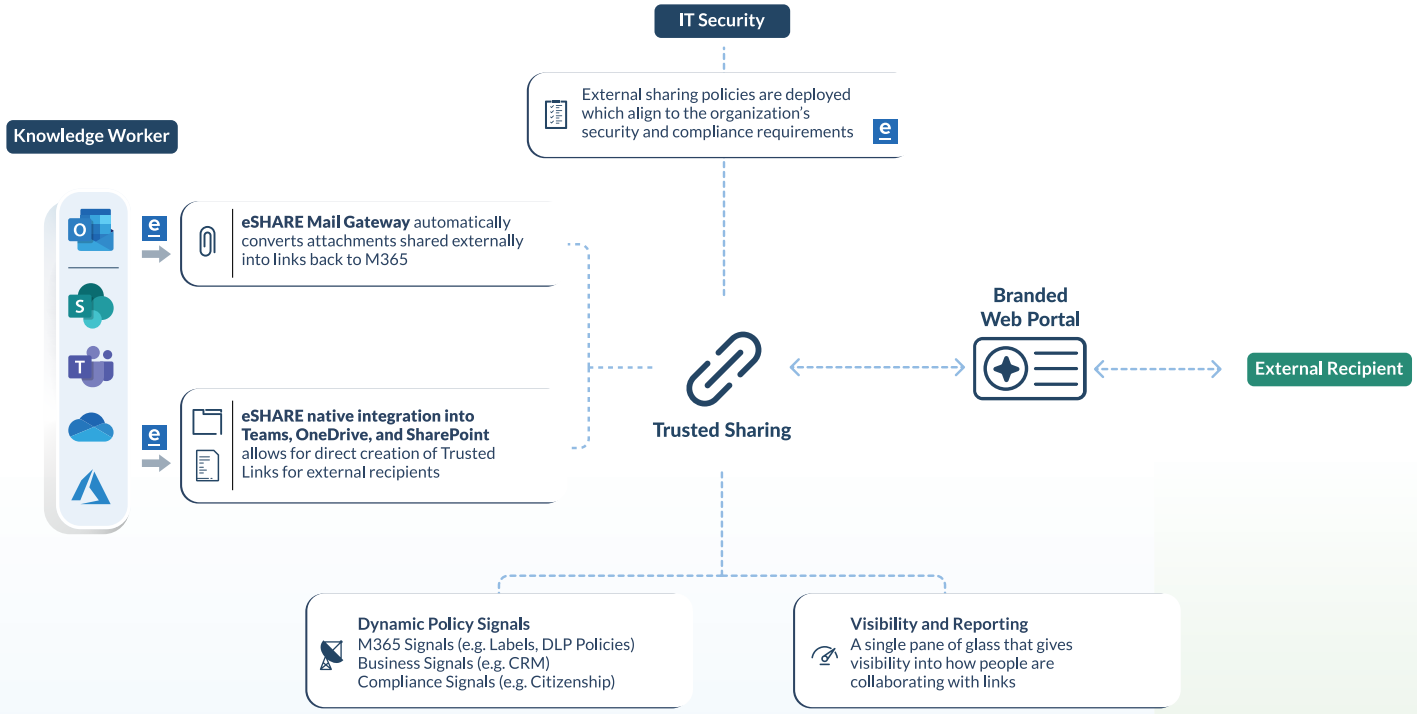

# Addressing the Collaboration Challenge

Microsoft 365 (M365) streamlines collaboration within individual tenants, replacing disparate on-premises solutions. However, inadequate controls and complex governance often leads to closed tenants for external sharing. Larger enterprises with multiple M365 tenants face further limitations on their intra-company sharing.

A modern solution must ensure secure link-based sharing, align with business processes, and provide detailed policy controls without getting in the way of work.

**eSHARE Collaborate is that solution.**

## Product Highlights

- Allows employees to self-service external sharing from M365 while meeting enterprise security and compliance requirements.
- Offers more than 30 out of the box governance controls that can meet unique enterprise requirements
- Automatically converts email attachments into trusted links without the employee having to be involved
- Provides a branded experience for external recipients, instilling trust
- Enables external parties to initiate sharing and invite colleagues to ongoing M365 collaborations
- Avoids link blocking that is common with native M365 links, assuring a 100% sharing reliability SLA

# Collaborating Without Compromise

eSHARE Collaborate enhances M365 security with 30+ pre-configured controls that reinforce external sharing governance around SharePoint, OneDrive, Teams, and Outlook. It ensures seamless link-based sharing remains persistent and secure across internal and external users, reducing administrative burdens and eliminating risky workarounds.

- **Prevents Oversharing:** Ensures only necessary information is accessed while adhering to information security policies.
- **Keeps data in M365:** Links to files are shared safely from M365 so that the data never leaves the organization.
- **Silent Guardrails:** Enforces security without disrupting user productivity.

## Zero Trust Sharing

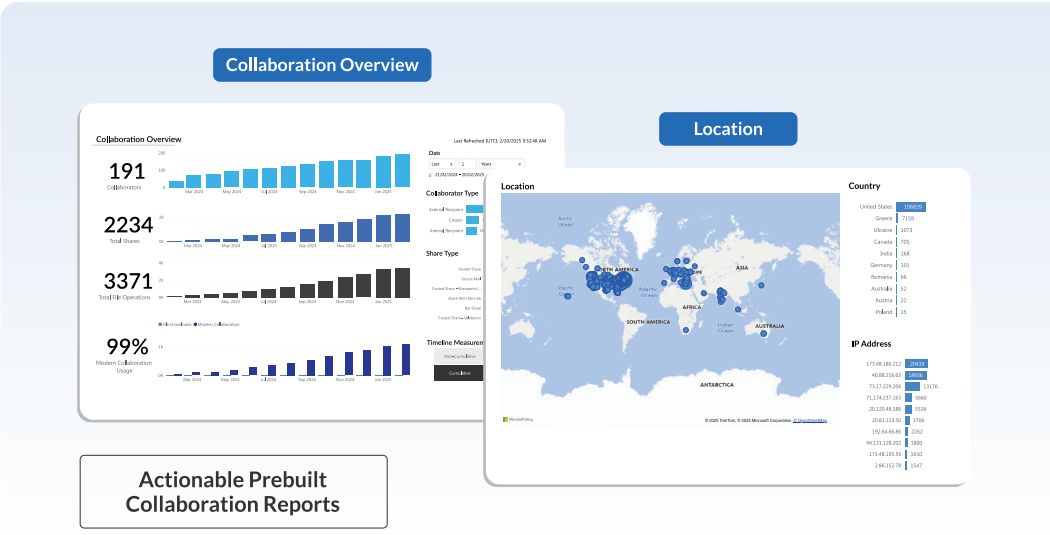

eSHARE Collaborate enforces Zero Trust at the point of link sharing as well as data access, following the principle of least privilege. It leverages Microsoft Purview signals (e.g. Labels, DLP policies) and dynamic sharing policies to prevent oversharing, ensuring data is only accessible to authorized recipients. Policies such as “download with justification” or “seamless expiration management” embody Zero Trust principles without security getting in the way of productivity.

## Stop Giving Data Away

Traditional file-sharing via email attachments loses control of data permanently. eSHARE Collaborate automatically converts attachments to secure links, keeping data within M365 while allowing external recipients controlled access through an organization’s branded portal.

## Analyze Collaboration Risks and Trends

Security and IT teams gain a single-pane of glass of external data-sharing activity, with full access to detailed analytics and compliance insights. Prebuilt Power BI reports provide instant and actionable understanding of security trends and external collaboration risks.

## Conclusion

eSHARE Collaborate optimizes M365 for secure external collaboration, empowering data owners to enforce compliance effortlessly. By enabling frictionless link-based sharing while maintaining robust security, it maximizes M365’s potential—allowing businesses to collaborate without compromise.
