Ulcer Solutions

The Next Evolution in Pressure Injury Prevention & Treatment

The Heel Keeper AFO

One Device. Two Clinical Phases. Continuous Protection.

Manage plantar flexion contracture while continuously offloading heel pressure in a single orthosis that adapts throughout the patient's recovery journey.

Provides Passive Dorsiflexion Positioning While Offloading the Heel

The Heel Keeper® AFO includes a removable rigid dorsiflexion footplate designed to gently push the ankle into a bent-up position. This helps maintain a dorsiflexed foot position and may help improve foot positioning over time when clinically appropriate.

Detachable Footplate

The removable footplate helps maintain the foot in a dorsiflexed position, providing a gentle passive stretch to support proper ankle positioning. The footplate can be removed for wound inspection, dressing changes, cleaning, or conversion to a heel offloading device.

Single Device, Multiple Settings

From the OR to the ICU, the ward or nursing facilities to home, the Heel Keeper AFO is suitable in every patient care setting.

Keeps Feet Cool

Breathable, moisture-wicking materials help manage heat and moisture, promoting comfort and encouraging compliance.

Comfortable

Comfortable materials and thoughtful design encourage longer wear time, supporting consistent offloading and positioning.
