NUEVOS YACIMIENTOS DE ORO: ASTEROIDE

Did you know this asteroid is full of gold and costs a whopping \$100,000 quadrillion

TOI Lifestyle Desk / etimes.in / Updated: Jul 29, 2024, 09:21 IST

The asteroid 16 Psyche, valued at \$100,000 quadrillion for its precious metal content, intrigues scientists and space enthusiasts. NASA's Psyche mission, launched in 2023, aims to explore this unique celestial body, potentially the exposed core of a protoplanet. However, challenges such as nascent mining technology and

The asteroid 16 Psyche, located in the asteroid belt between Mars and Jupiter, has captured the imagination of scientists and space enthusiasts alike. This metal-rich asteroid is estimated to be worth a staggering \$100,000 quadrillion due to its abundant reserves of precious metals, including gold, platinum, and nickel. Discovered in 1852 by Italian astronomer Annibale de Gasparis, 16 Psyche is about 140 miles in diameter, making it one of the largest asteroids in the asteroid belt.

Deep-sea mining: A new gold rush or environmental disaster?

Environmentalists warn deep-sea mining could cause major damage to unknown ecosystems, yet mining companies argue it is the key to the energy transition.

Many scientists and conservationists are calling for a pause or moratorium on plans for deep-sea mining [Gustavo Graf/Reuters]

Emission of elemental gold particles from Mount Erebus, Ross Island, Antarctica

Abstract

Volcanoes are an important source of gases and aerosols in the atmosphere. Significant quantities of trace elements are emitted as vapor species [Nriagu, 1989; Symonds *et al.*, 1987] and are strongly enriched in the gas relative to the magma [Tazieff and Sabroux, 1983; Crowe *et al.*, 1987]. After eruption the trace elements condense on ash and other particles or they form sublimates and agglomerates. Here we report on the emission of gold (Au) from Mount Erebus, Antarctica. Although the flux of emitted Au is low compared to other volcanoes, crystalline particulate Au has been found in the plume near the crater, in ambient air up to 1000 km from the volcano and in near surface samples. Vapor phase transport of Au may occur as a chloride species and could be an important transport mechanism in crystallizing magmatic intrusions.
