

About TRONITY

TRONITY was founded in 2020 in Mannheim, Germany by former SAP employees Torsten Born, Sebastian Netuschil, and Nils Machner. The company develops digital twins for electric and plug-in hybrid vehicles, enabling drivers, fleet operators, and asset managers to gain full transparency across the entire vehicle lifecycle – without the need for additional hardware.

By analyzing real-time vehicle data, TRONITY provides insights into operating costs, charging behavior, and vehicle health, empowering data-driven decisions. Thanks to direct data access agreements with over 20 leading automotive manufacturers – including Mercedes, Volkswagen, Ford, BMW, and Tesla – TRONITY ensures a reliable, independent connection to vehicle data across brands.

The product portfolio includes a driver-focused mobile app, a legally compliant and independently audited digital logbook, and a web-based fleet management platform. Features such as home charging reimbursement and battery health diagnostics (patent pending) add further value in an increasingly data-driven mobility ecosystem.
