

Fuglur og hara

Í Flatnahaga búleikast tjaldur, spurvur, lógv, mýrisnípa og annar heiðafuglur. Harumframt er eisini nógv av haru. Tá ið man fer undir eina verkætlan sum hesa, sum er av slíkum vavi, so má man taka atlit til tey, sum húsast her frammanundan. At reisa eina vindmyllulund er at gera inntriv í teirra øki. Tí vóru atlit tikin teimum at frama, so sum at øll bygging og annað virksemini varð steðgað í verping. Og harafturat áløgdu vit okkum at telja heiðafuglin og gera niðurskrivingar, so at vit kunnu hava eftirlit við langtíðarárinum í økinum.

The birds and the hares

Flatnahagi is home to oystercatchers, golden plovers, snipes, and many other birds. Additionally, there are also plenty of hares. When starting a project of such size and scale, one must consider those who already live here. Building these wind turbines is intruding on their habitat. Therefore, preventive measures were taken, such as all construction and other activities put on hold during the breeding season. Furthermore, we were required to count the birds and do reports so that we could monitor the impact in the area in the long term.
