

SOLUTION BLUEPRINT TL-1: ACCESS TIME-LOCK

Time-lock based connectivity triggers for timed access windows

Name **Controlled Access Time-lock**

Application Protected zone access

Sectors Enterprise, Utility, CNI, Defense

Description A Firebreak is positioned between two logical zones—internal system, and external network—in a configuration like an access gate.

The connection is only opened at pre-determined times and in a manner that cannot be enumerated by an external threat.

Typical examples include nightly backup windows to prevent access to backup systems outside of specific time windows.
