WHY ASSESS AND MIGRATE WITH LOKA

500+ GenAI projects. We've seen your migration before

Our Claude and AWS expertise shows you what to migrate and where re-architecture is needed. We don't learn on your engagement.

One system, one architecture, everything centralized

Not just a model move. Access to the entire AWS ecosystem, one account, one bill, one audit trail.

Inventory before you commit

Every workload assessed before any migration budget is signed. Go, wait, or re-architect: per workload.

HOW IT WORKS

- 01

Phase 1: One-Week Assessment + Optional Benchmarking

Inventory your first-party workloads to determine what migrates cleanly and what needs re-architecture. Each gets a Go, Wait, or Re-architect recommendation. Closes with a migration plan ready for executive sign-off.
- 02

Phase 2: The migration, timeline scoped after assessment

Once your team gives the Go, Loka can migrate and deploy your Claude workloads on Amazon Bedrock using native AWS architecture, all logging and security controls included. Validated, cut over, and handed off to your team.

WHAT YOU GET

Claude family models inside your AWS account

Claude stays Claude. No prompt changes, now running inside your account with full AWS ecosystem access.

AWS spend and funding unlocked

Every inference call on Bedrock counts toward your EDP or PPA. Assessment is 100% funded and Loka surfaces any additional AWS programs that apply.

Migration path and executive decision summary

What moves, what waits, what needs re-architecture: board-ready, one motion from assessment to migration.

“Loka jumped in as an extension of our team and started contributing right away. Their expertise across AWS, ML and data is invaluable.”
