

ONVIF Events & Metadata — Integration Cheat Sheet

Events say "something happened"; metadata describes "what is in the scene." This one-pager maps how each travels from a camera into a VMS, what Profile M guarantees, and the four traps that break analytics pipelines.

The two channels: what travels from camera to VMS

Channel	What it carries	How it reaches the VMS
Events	"Something happened" — motion, line cross, zone entry, a count change, a plate or face hit	ONVIF events service (pull or push); optionally MQTT/JSON
Metadata	"What is in the scene" — per frame: each object's box, center, class, and tracking id	VND.ONVIF.METADATA track over RTP, alongside the video

Events delivery: pull vs push (a device supports at least one)

Model	How it works	Use it when
Pull — PullPoint	VMS creates a subscription and calls PullMessages to fetch queued events	Across firewalls / NAT; the safe multi-vendor default
Push — Base Notification	VMS subscribes once; the camera sends a Notify the instant an event fires	You control the network and need lowest alert latency
Both	Ride OASIS WS-BaseNotification 1.3 topics; subscribe by topic to filter	Always — subscribe only to the topics you need

Profile M: mandatory vs optional — read the Declaration of Conformance

Feature	Status	Note
Metadata streaming (RTP)	Mandatory	The scene-description stream itself
Analytics service	Mandatory	Discover and configure analytics modules
MQTT / JSON events	Optional	The IoT bridge — verify it on the DoC
Rule engine	Optional	Line-cross, zone, counting rule authoring
Geolocation / face / plate	Optional	Rich attributes vary by firmware build

The four traps that break analytics pipelines: (1) archive the metadata — most VMS discard it, so forensic search is empty a week later; (2) sync clocks — NTP drift misaligns metadata with the video frame; (3) map class taxonomies — one vendor's "Human" is another's "Person"; (4) tame event storms — raise confidence thresholds, aggregate by object id, and filter by topic. ONVIF standardizes the format and transport, never the detection accuracy or the rule-authoring format. GO DEEPER · THE 7-VOLUME HANDBOOK

Fora Soft Video Engineering Handbook

Seven volumes, 9,000+ pages: encoding, streaming, audio and AI for video products — from the pixel to production.

By Nikolay Sapunov, CEO at Fora Soft · Kindle & paperback on Amazon

[Browse the handbook on Amazon →](#)

This sheet maps how events and metadata travel from camera to VMS, what Profile M guarantees and the traps that break analytics. Our seven-volume handbook covers the stack behind it: start with Volume 6 for detection, tracking and search over video, then Volume 7 for real-time pipelines and Volume 1 for the streams carrying the metadata.

WHAT YOU WILL FIND INSIDE

- Detection and tracking that produce metadata
- Real-time analytics pipelines and event storms
- Search and RAG over a video archive
- Video streams and timestamps the metadata rides on

THE FULL HANDBOOK · 7 VOLUMES · 9,000+ PAGES · ALL ON AMAZON

Vol. 1 · Video Encoding — pixels and color to H.264, HEVC, AV1, quality metrics and AI

Vol. 2 · Video Streaming I — network transport, contribution and ingest, HLS, MPEG-DASH, CMAF

Vol. 3 · Video Streaming II — ABR, CDNs, players, WebRTC, DRM and the economics of delivery

Vol. 4 · Audio for Video I — PCM, codecs, loudness, accessibility, real-time voice processing

Vol. 5 · Audio for Video II — jitter buffers, lip sync, Atmos, quality metrics, neural codecs

Vol. 6 · AI for Video I — models and inference, computer vision, speech, search, generative video

Vol. 7 · AI for Video II — real-time pipelines, agents, serving, cost, compliance, verticals

Getting camera analytics events into your VMS reliably?

We will wire ONVIF events and metadata from your cameras into your VMS, archive them for search, and tune thresholds to stop event storms. 250+ video products shipped since 2005.
