

Speech Codecs — Cheat Sheet

G.711 vs G.722 vs AMR vs EVS — bandwidth, bitrate, where you meet them, and the transcoding ceiling.

The one fact

When your call hits the phone network, a gateway transcodes Opus into a speech codec. That far-side codec is the quality ceiling: land on G.711 and it can only sound like a phone.

The four codecs at a glance

Codec	Year	Bandwidth	Bitrate	Where
G.711	1972	Narrowband 3.4 kHz	64 kbit/s fixed	VoIP/SIP fallback, PSTN
G.722	1988	Wideband 7 kHz	48/56/64 kbit/s	Desk phones, conf. bridges
AMR	1999	Narrowband 3.4 kHz	4.75–12.2 (8 modes)	2G / 3G mobile voice
AMR-WB	2001	Wideband 7 kHz	6.6–23.85 (9 modes)	3G / 4G HD Voice
EVS	2014	NB → Fullband 20 kHz	5.9–128 kbit/s	VoLTE / VoNR, modern mobile

What to remember

Speech vs music	Speech codecs model the vocal tract (ACELP) — carry a voice at far lower bitrate than music codecs.
G.711 = the floor	Two ends that agree on nothing else fall back to G.711. RTP PT 0 = mu-law, PT 8 = A-law.
Wideband caveat	Wideband helps only if every box in the path supports it AND the source was captured wide.
AMR adapts	AMR / AMR-WB switch bitrate every 20 ms to survive bad radio — more bits when signal is strong.
EVS = AMR-WB compatible	EVS reaches fullband 20 kHz and talks to AMR-WB phones without a quality-wrecking transcode.

Pitfall: 'wideband' does not guarantee a better call

One narrowband box in the path drags the whole call back to 3.4 kHz. Design for the weakest link, not the codec name in your own config. Minimize transcodes; keep a clean G.711 fallback.

This sheet compares G.711, G.722, AMR and EVS and explains why the far-side codec sets the call's quality ceiling. Volume 1 covers compression in depth: how codecs model their signal, how bitrate trades against quality, and how to measure the result with objective metrics.

Vol. 1 · Video Encoding — pixels and color to H.264, HEVC, AV1, quality metrics and AI

Vol. 2 · Video Streaming I — network transport, contribution and ingest, HLS, MPEG-DASH, CMAF

Vol. 3 · Video Streaming II — ABR, CDNs, players, WebRTC, DRM and the economics of delivery

Vol. 4 · Audio for Video I — PCM, codecs, loudness, accessibility, real-time voice processing

Vol. 5 · Audio for Video II — jitter buffers, lip sync, Atmos, quality metrics, neural codecs

Vol. 6 · AI for Video I — models and inference, computer vision, speech, search, generative video

Vol. 7 · AI for Video II — real-time pipelines, agents, serving, cost, compliance, verticals

Connecting your video calls to phone networks without losing quality?

We will map every transcode in your call path, keep wideband end to end where it exists, and set a clean G.711 fallback. 250+ video products shipped since 2005.
