

Sovereign Cloud

CHALLENGE

Regulatory pressure

GDPR, the EU Data Act and DORA mandate strict data residency and operational control. Compliance is no longer optional.

Hyperscaler dependency

Over-reliance on US cloud providers creates legal exposure under the CLOUD Act, financial lock-in and extraterritoriality risks.

Migration complexity

Treating cloud migration as a compliance checkbox fails to deliver operational resilience or business value.

Economic blind spot

Cloud cost opacity, vendor pricing power and unpredictable TCO can erode financial independence over time.

SOLUTION

Celfocus combines multi-cloud expertise across AWS, Azure, GCP, Oracle and OVH with a Cloud Centre of Enablement (CCoE), as a **sovereign-first cloud alternative partner**.

The approach covers workload assessment, sovereign architecture design and end-to-end migration, alongside observability, Agentic AI acceleration and continuous compliance across platforms.

Terraform **Agentic AI** and **code** generation agents, governed by the Celfocus CCoE, further support cloud transformation within sovereign guardrails.

BENEFITS

Regulatory confidence

Full compliance with GDPR, the EU Data Act, DORA and ISO standards.

Multi-cloud independence

No reliance on a single hyperscaler, with multi-cloud architecture protecting continuity and portability.

Operational control

Architecture designed to avoid vendor lock-in and maintain full control across cloud environments.

Financial independence

Full FinOps visibility from day one, helping govern cloud spend and reduce extraterritorial cost exposure.

Faster innovation

Agentic AI and DevSecOps pipelines accelerate delivery within sovereign guardrails.

Operational resilience

24/7 SLA-backed managed services for critical telecom and financial services workloads.

Competitive edge

A sovereign, compliant cloud becomes a genuine market differentiator – not just a regulatory obligation.
