

## Discharge Instructions For Acute Rash

## Discharge Instructions For Acute Rash

### Acute Rash

It is an irritation, redness, or itchiness in the skin or mucus membranes (Mucus membranes are areas such as the lining of your nose or throat), and it starts suddenly, worsens quickly, and lasts a short time.

An acute rash may be caused by a disease, such as dermatitis or vasculitis. The rash may be a reaction to something you are allergic to, such as certain foods, or latex. Certain medicines, including antibiotics, NSAID (Non-Steroidal Anti-inflammatory Drugs), pain medication, and aspirin can also cause a rash.

### Discharge Instructions

Come to emergency room in case of:

- You have sudden trouble breathing or chest pain.
- You are vomiting, have a headache or muscle aches, and your throat hurts.

Follow up with dermatology clinic within (2 to 3 days) in case of:

- You have a fever.
- You get open wounds from scratching your skin, or you have a wound that is red, swollen, or painful.
- Your rash lasts longer than 3 months.
- You have swelling or pain in your joints.
- You have questions or concerns about your condition or care.
