

BAGACEIRA FIBER BOARD

BAGACEIRA Fiberboard is a lightweight, biodegradable panel made from sugarcane bagasse—the fibrous residue left after alcohol or sugar production—bound with natural binders and tinted with plant, clay, and mineral pigments. Available in an earthy, versatile color palette, the material can be cast into flat sheets or formed into 3D shapes for applications such as lighting, wall coverings, and decorative furnishings. Each piece sequesters carbon captured during the sugarcane growth cycle, preventing emissions from bagasse that would otherwise be burned or discarded. Designed and produced in Spain, with bagasse sourced from a local rum factory, **BAGACEIRA Fiberboard** merges craft and sustainability, turning agricultural waste into durable, toxin-free interior materials.

MATERIAL PROPERTIES

Lightweight

Can be cast into 2D or 3D forms

Biodegradable / compostable

Sturdy

Non-toxic

VOC-free

Acoustic absorption

NATURAL TONES

Full color library available upon request.

POSSIBLE APPLICATIONS

Lighting fixtures

Wall panels

Decorative furnishings

Acoustic tiles

Partition elements

Display surfaces

Sculptural installations
