NCE Project No. 164.24.30

Executive Summary

Nichols Consulting Engineers, Chtd. (NCE) was selected by the City of Corona (City) to perform an update of its Pavement Management Plan (PMP) using a semi-automated condition survey. The purpose of the PMP is to help educate policymakers about the current condition of the street network and the impact of various scenarios on future network conditions. This report summarizes the findings from the 2024 PMP Update.

The City is responsible for maintaining approximately 388.6 centerline miles of streets¹, representing a substantial investment of approximately \$749.9 million. The street network includes 252.1 miles of local streets, 68.7 miles of collector streets, and 67.8 centerline miles of arterial streets. In February of 2023, NCE performed a condition survey for the City's street network. Table A below summarizes the network's current Pavement Condition Index (PCI) breakdown by functional classification.

Table A. Street Network PCI Breakdown

Functional Class	Centerline Mileage	Percent Area	Weighted Average PCI ²	Condition
Local	252.1	56.7%	71	Good
Collector	68.7	17.1%	73	Good
Arterial	67.8	26.2%	74	Good
Total	388.6	100.0%	71	Good

The current weighted (by area) average PCI of the City of Corona's street network is 71. Overall, 53.9 percent of the City's street network is in "Very Good" or "Good" condition, 39.3 percent is in "Fair" condition, 6.8 percent is in "Poor" or "Very Poor" condition. Utilizing the StreetSaver[®] PMP software, the budget needs analysis³ indicated that the City would need to spend approximately \$203.4 million over the 10-year analysis period (2025 to 2034) to bring the overall network to a condition that can be maintained with ongoing preventive maintenance in the most cost-effective way. However, this is an idealized approach where a substantial funding investment is made in the first year to bring most of the street network to "Very Good" or "Good" condition (requiring only preventive treatment) and thereby reducing the cost in subsequent years. In practice, most agencies adopt a strategy that balances both feasibility and cost-effectiveness.

To establish a practical approach, 4 budget scenarios were performed as part of this report using an annual inflation factor of 5.0 percent. The budgeted amounts for the 4 scenarios reflect the total project costs, including staff time, design, construction management, contingencies, and all non-Asphalt Concrete (AC) related work. It should be noted that the City currently has already programmed projects that will be constructed in 2024. These projects consist of slurry seal and mill-and-overlay treatments and are expected to increase PCI from 71 to 74 by the end of 2024. The following budget scenarios were performed as part of the report in conjunction with the upcoming project.

¹ The City also maintains 18.7 centerline miles of alleyways which are not part of this PMP Update.

² The weighted average PCI is a result of multiplying the area of each street section by the PCI of that section, totaling all sections together, and then dividing by the total area of the network area or functional classification.

³ Analysis developed by StreetSaver[®] to determine the amount of funding (without limitation) necessary to improve and maintain all streets to Category I condition (street's PCI greater than or equal to 70).

- **Scenario 1: City’s Existing Funding (\$9.8M to \$13.2M per year)** – At the City’s current funding level of \$114.0 million, the network PCI is projected to increase from 71 to 74 by the end of year 2025, and then will decrease from 74 to 69 by the end of 2034. The deferred maintenance will increase from \$113.2 million to \$202.0 million by the end of 2034.
- **Scenario 1B: Worst Streets First (\$9.8M to \$13.2M per year)** – The goal of this scenario is to minimize the percentage of pavements in ‘Very Poor’ condition using the City’s existing funding. Compared to Scenario 1, streets are selected for treatment based on their condition rather than the cost-effectiveness of their treatment. The results show that PCI drops to 68 and deferred maintenance increases to \$194.5 million by the end of 2034.
- **Scenario 2: Maintain Minimum 71 PCI (\$11.2M to \$15.0M per year)** – The result shows that the City will need to spend a total of \$130.0 million over the next 10 years (approximately \$13.0 million per year) to maintain the network at a minimum PCI of 71. Additionally, deferred maintenance will increase from \$90 million to \$181.5 million by the end of 2034.
- **Scenario 3: All Streets that Need Treatment (\$19.0M to \$23.0M per year)** – This scenario will require approximately \$10.0 million annually in addition to existing funding, which is a total of \$199.0 million over the next 10 years. The City will be able to increase the PCI from 71 to 80 by the end of 2034. The deferred maintenance will decrease to \$76.0 million by the end of 2034.

The following table summarizes each scenario with its corresponding 10-year budget, and the PCI and deferred maintenance at the end of the analysis period.

Table B. Budget Scenario Analysis Summary

Scenario	Description	Budget (\$M)	By End of 10-Year Plan	
			Network PCI	Deferred Maintenance (\$M)
1	City’s Existing Funding	114.0	69	202.0
1B	Worst Streets First	114.0	68	194.5
2	Maintain Minimum 71 PCI	130.0	71	181.5
3	All Streets that Need Treatment	199.0	80	76.0

As part of the City’s strategy to preserve the road network and systematically address different areas of the City, 10 PMP Zones were developed—1 zone of each year of the 10-year PMP Plan. The zones were created based on their geographical location (i.e., neighborhoods) and included collector and local streets, while arterial streets (including minor arterials) were kept separate from the zone and were treated independently based on the cost-effectiveness. Approximately 20 percent of the annual budget is allocated to arterials and 80 percent to the zone. Table C provides the summary condition by zone.

Table C. PMP Zone PCI Breakdown

Functional Class	PMP Zone	Centerline Mileage	Percent Area	Weighted Average PCI	Condition
Local/Collector	Zone 1	27.5	6.4%	67	Fair
	Zone 2	29.3	6.7%	68	Fair
	Zone 3	32.0	7.6%	70	Good
	Zone 4	33.6	7.6%	70	Good
	Zone 5	35.8	8.3%	74	Good
	Zone 6	31.5	7.5%	74	Good
	Zone 7	33.0	7.4%	73	Good
	Zone 8 ⁴	28.1	5.7%	65	Fair
	Zone 9	31.1	7.7%	72	Good
	Zone 10	38.9	8.9%	75	Good
Arterial		67.8	26.2%	74	Good
Total		388.6	100.0%	71	Good

In summary, the City of Corona has a substantial investment of \$749.9 million in their pavement network. Overall, the pavement network is in “Good” condition with a PCI of 71. 10 zones were developed for each year of the 10-Year PMP Plan to utilize an area-based approach for addressing pavement issues, starting in the year 2025. The City’s existing budget (Scenario 1) of \$114.0 million over 10 years is expected to decrease the overall network PCI from 71 to 69, by the end of 2034. Scenario 2 aims to maintain PCI at a minimum of 71 by increasing the current budget to \$130.0 million over 10 years. Scenario 3 will address all the streets in each zone that require any type of maintenance treatment by adding approximately \$10.0 million to the existing funding.

NCE recommends that the City increase the funding level to improve the network condition and decrease deferred maintenance. Scenario 3 accomplishes both these objectives by gradually increasing PCI from 71 to 80 and decreasing the deferred maintenance from \$113.2 million to \$76.0 million by the end of 2034. However, because Scenario 3 requires a substantial financial commitment, **NCE recommends that the City pursue Scenario 2** and maintain a minimum PCI of 71. NCE recommends that the City increase annual funding by \$2.5 million per year to achieve this goal.

⁴ Zone 8 was selected in the later years because most of the street sections are currently under construction

Quality Control Plan (QCP)

1 Introduction

Nichols Consulting Engineers, Chtd. (NCE) was selected by the City of Corona to perform an update of the City's Pavement Management Plan (PMP). To update the City's PMP, NCE performed pavement condition surveys in compliance with ASTM D6433⁵. The surveys did not include non-pavement issues such as traffic, safety and street hazards, geometric issues, shoulders, sidewalks, curb and gutters, drainage issues, or immediate maintenance needs.

After inspection, all survey data was entered into the City's StreetSaver® database, and Pavement Condition Index (PCI) calculations were performed. NCE then met with City staff and reviewed and updated the City's decision tree including maintenance and rehabilitation (M&R) strategies and treatment unit costs. A budget needs analysis was then performed, and 4 types of budget scenarios were analyzed.

In general, PMPs are "designed to provide objective information and useful data so that managers can make more consistent, cost effective and defensible decisions related to the preservation of a pavement network."⁶ In other words, a PMP is designed to assist cities with answering questions such as:

- What does the City's pavement network include?
- What is the current condition of the pavement network?
- What are the City's current M&R strategies?
- How much funding is required to perform all needed M&R treatments over the next 10 years?
- What effect with the City's existing funding have on the network condition and overall deferred maintenance?
- What effect will other funding levels have on the network condition and deferred maintenance?

1.1 Purpose

The purpose of this report is to assist policy makers in using the results of the PMP. This report analyzes different levels of funding and maximizes the return from expenditures by selecting the most cost-effective repairs.

This report assists the City with identifying M&R priorities specific to the City's needs, and highlights options for improving the current PCI. These options are developed by conducting "what-if" analyses using StreetSaver® software. By varying the budget amounts available for pavement maintenance and repair, the impact of different funding strategies on the City's streets for the next 10 years was determined.

A comprehensive pavement condition survey was conducted in February 2023, adhering to ASTM D6433 protocols for the entire project. This survey encompasses the City's network, providing a holistic assessment of pavement conditions. The PMP report offers a comprehensive understanding of the overall infrastructure condition and facilitates effective planning and maintenance strategies for the City.

⁵ ASTM. *ASTM D6433. Standard Practice for Roads and Parking Lots Pavement Condition Index Surveys*. (West Conshohocken, PA: ASTM International, 2023), [astm.org](https://www.astm.org).

⁶ AASHTO *Guidelines for Pavement Management Systems*. (Washington, DC: American Association of State Highway and Transportation Officials, 1990).

The linkage between the City's StreetSaver® database and GIS shapefile was repaired and updated. The GIS linkage update resulted in several adjustments to section limits, addition of new sections, the removal of redundant sections and private roads, and updates to section attributes such as length, width, area, surface type, and functional class. The final GIS shapefile was approved by the City and reuploaded back into StreetSaver®.

NCE assisted the City in developing PMP Zones. The purpose was to start an area-based maintenance strategy where each zone per year is treated over a 10-Year PMP Plan. Furthermore, NCE assisted the City in creating a detailed work plan to align with the current Capital Improvement Projects (CIP), sewer line repairs, and water line projects.

2 Zone Distribution

Agencies often develop a zone approach in the implementation of their maintenance and rehabilitation program. The traditional approach can be challenging for large Cities, because it looks at the whole network and addressed streets in a way that may seem scattered and random. A zone approach addresses pavement issues in different areas of the City while trying to minimize mobilization costs from contractors. Residents will gain an understanding of when pavement issues in their area are being addressed, thereby allowing the City to address concerns more efficiently. It also allows for more efficient coordination between interdepartmental groups and utility companies. NCE developed 10 PMP zones for the City. The approach and assumptions that were followed to develop the zones were:

- Zones consist of local and collector streets.
- Arterials (including minor arterial streets) were considered separately from the zones.
- All streets within a zone will be eligible for treatment within the 10-year period of the PMP plan as funding allows.
- The zone boundaries were primarily balanced by:
 - total pavement area – a function of total centerline miles and street widths.
 - geographical location – similar neighborhoods or boundaries defined by arterial streets.
 - budget needs⁷ – total cost of M&R work needed as a function of pavement condition.
- Minor adjustments were also made to zone boundaries with consideration to prioritization.

Once the zones were distributed, 3 prioritization approaches were evaluated to determine the order each zone is addressed in the 10-year PMP Plan:

- **Prioritize zones closest to the critical PCI of 55.** The deterioration rate of pavements is not linear; new pavements deteriorate slower than pavements in poor condition. The deterioration rate of pavements increases after an inflection point, which typically occurs around a PCI of 55. As pavements pass this inflection point, the snowballing deterioration can lead to higher treatment costs (i.e., major rehabilitation or reconstruction). Therefore, addressing zones closest to the critical PCI of 55 targets more streets that are about to cross a threshold leading to more costly treatments. However, because all zones currently have an average PCI above 55, this approach is the same as prioritizing zones in poor condition first.
- **Prioritize zones in good condition.** This is the opposite of the previous approach and prioritizes zones with pavements in relatively good condition. Pavements in good condition require less costly (typically preventive) treatments. Prioritizing cost-effective treatments equates to more treatment coverage early in the 10-year PMP Plan. However, while preventative maintenance improves PCI, it does not necessarily improve deterioration rate as rehabilitation or reconstruction does. Over a 10-year period, the benefits of prioritizing cost-effective treatments are counter-balanced by a lengthy period of deterioration.

⁷ Budget “needs” refers to amount of funding required (if funding is unlimited) for each street in each zone to achieve and maintain optimal condition based on the policy established in the decision tree.

- **Alternating between zones in good and poor condition.** This last approach is a combination of the 2 previous approaches by alternating between zones in relatively poor condition in 1 year and relatively good condition in the following year.

Multiple scenario analyses were performed using StreetSaver® to project the network PCI at the end of the analysis period using the above approaches. Ultimately, the results showed that **prioritizing the zones closest to the critical PCI of 55 (i.e., zones in poor condition first) was the optimum approach**. Figure 1 shows the map with the 10 zones that were created. Note that the zone number corresponds to the order in which the zone is to be treated; Zone 1 will be treated in Year 1, Zone 2 in Year 2, and so on, until Zone 10 in Year 10.

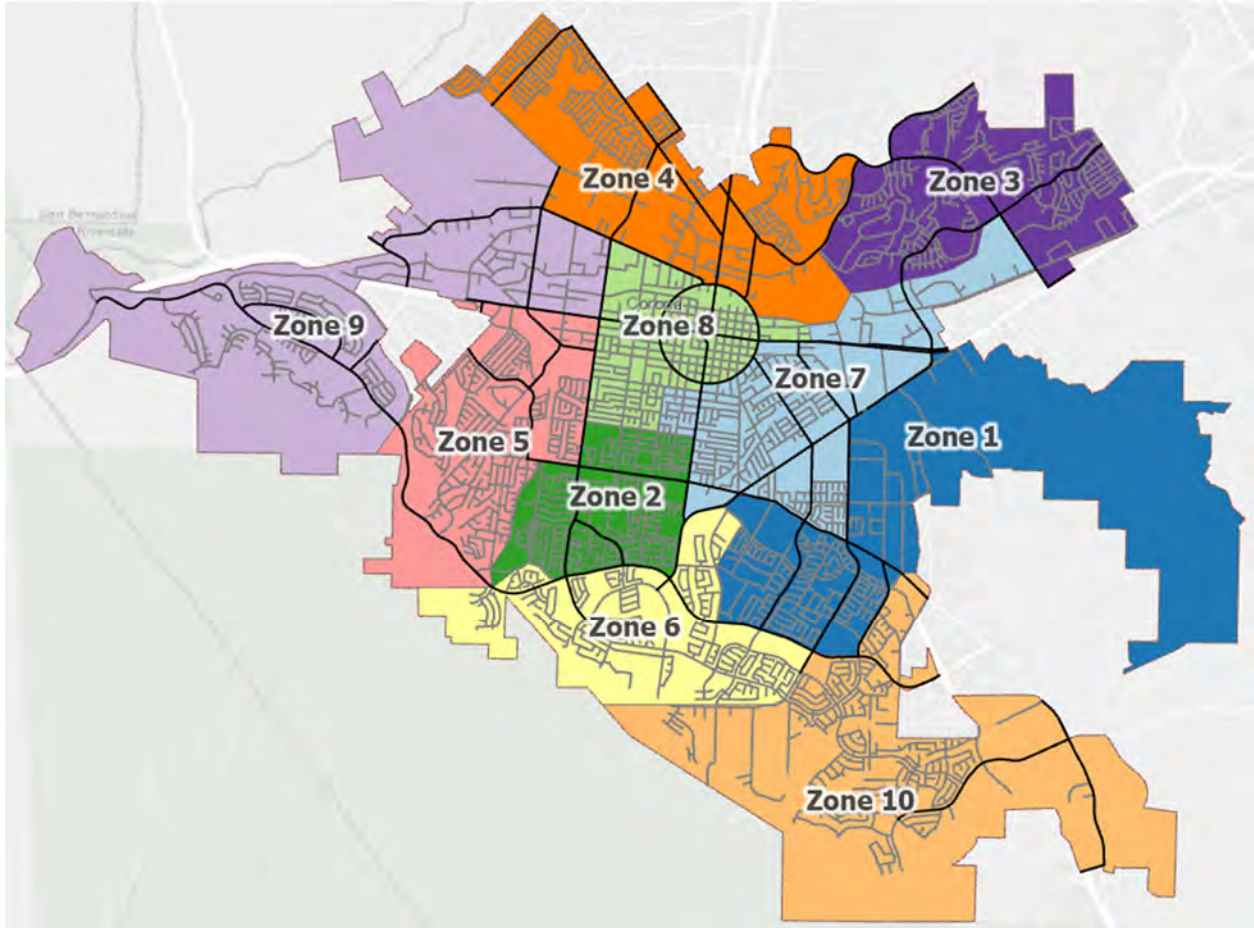

Figure 1. City of Corona PMP Zones.

3 Network Summary

The City is responsible for maintaining approximately 388.6 centerline miles of pavement, which includes 252.1 centerline miles of local streets, 68.7 centerline miles of collectors, and 67.8 centerline miles of arterial. The network is composed primarily of asphalt concrete (AC) pavement with a few sections of Portland cement concrete (PCC) pavement. Table 1 summarizes the street network by functional classification.

Table 1. Network Summary Statistics by Functional Class

Functional Class	Centerline Mileage	Percent Area	Weighted Average PCI ⁸	Condition
Local	252.1	56.7%	71	Good
Collector	68.7	17.1%	73	Good
Arterial	67.8	26.2%	74	Good
Total	388.6	100.0%	71	Good

NCE assisted the City in creating 10 PMP Zones. These zones only include collectors and local roads. The summary for each zone and their condition is shown in Table 2. The purpose of creating zones is to establish a maintenance and rehabilitation schedule in which the needs are addressed for 1 zone per year.

Table 2. Pavement Condition Summary by Zones

Functional Class	PMP Zone	Centerline Mileage	Percent Area	Weighted Average PCI	Condition
Local/Collector	Zone 1	27.5	6.4%	67	Fair
	Zone 2	29.3	6.7%	68	Fair
	Zone 3	32.0	7.6%	70	Good
	Zone 4	33.6	7.6%	70	Good
	Zone 5	35.8	8.3%	74	Good
	Zone 6	31.5	7.5%	74	Good
	Zone 7	33.0	7.4%	73	Good
	Zone 8	28.1	5.7%	65	Fair
	Zone 9	31.1	7.7%	72	Good
	Zone 10	38.9	8.9%	75	Good
Arterial		67.8	26.2%	74	Good
Total		388.6	100.0%	71	Good

Street pavements are one of the City's most valuable assets, and the **total street network replacement cost is estimated to be approximately \$749.9 million**. This can be viewed as the value of the pavement network and is the amount needed to fund a reconstruction of the entire paved network. It does not include related infrastructure assets such as sidewalks, signals, markings, signs, or storm drains.

⁸ The weighted average PCI is a result of multiplying the area of each street section by the PCI of that section, totaling all sections together, and then dividing by the total area of the network area or functional classification.

4 Pavement Condition

The pavement condition index, or PCI, is a measurement of pavement grade or condition and ranges from 0 to 100. A newly constructed street will have a PCI of 100, while a “Very Poor” condition street will have a PCI of 25 or less. The pavement condition is primarily affected by the climate, traffic loads and volumes, construction materials and age. The symptoms manifested by the pavement as it ages or fails are determined by the distress types that are present, which include: (for asphalt pavements, and Portland cement pavement)

Asphalt Concrete (AC) Pavements:

- Alligator (Fatigue) Cracking
- Bleeding
- Block Cracking
- Bumps & Sags
- Corrugation
- Depression
- Edge Cracking
- Joint Reflection Cracking
- Lane/Shoulder Drop-Off
- Longitudinal/Transverse Cracking
- Patching and Utility Cut Patching
- Polished Aggregate
- Potholes
- Railroad Crossing
- Rutting
- Shoving
- Slippage Cracking
- Swell
- Raveling
- Weathering

Portland Cement Concrete (PCC) Pavements:

- Blowup/Buckling
- Corner Break
- Divided Slab
- Durability Cracking
- Patching (Large and Small)
- Linear Cracking
- Popouts
- Pumping
- Punchout
- Scaling
- Spalling (Corner and Joint)

The photographs in Figure 2 illustrate examples of the City’s AC streets and show a range of PCIs for each condition category.

Figure 2. Examples of Streets with Different PCIs.

The definitions of the pavement condition categories and PCI ranges are identified in Table 3. The PCI scale is divided into 5 general condition categories. Pavements in “Very Good” condition have a PCI at or above 86, pavements in “Good” condition have a PCI between 70 and 85, pavements in “Fair” condition have a PCI between 50 and 69, pavements in “Poor” condition have a PCI between 25 and 49, and finally pavements in “Very Poor” condition have a PCI at or below 25.

Table 3. Pavement Condition Categories

Condition Category	PCI Range	Description
Very Good	86-100	Pavements which have little or no distress. These pavements have been recently constructed or resurfaced.
Good	70-85	Pavements with minimal surface distress that may include some hairline longitudinal/transverse cracks and/or weathering. The pavement structure is sound, and minor oxidation may occur.
Fair	50-69	Pavements with significant distress that is predominantly non-load-related, such as longitudinal/transverse cracks, bleeding, block cracking, weathering, raveling, etc. The pavement structure is sound, and some oxidation has occurred.
Poor	25-49	Pavements with moderate to severe surface distresses. Extensive weathering or raveling, block cracking, and load-related distresses such as alligator cracking, rutting, and potholes may occur.
Very Poor	0-24	Pavements with severe weather-related distress and large quantities of load-related distress. These pavements are nearing the end of their service life.

The City's overall weighted average PCI for the network is 71, which places the overall street network pavement condition in the "Good" category. Figure 3 breaks down the current network PCI by functional classification.

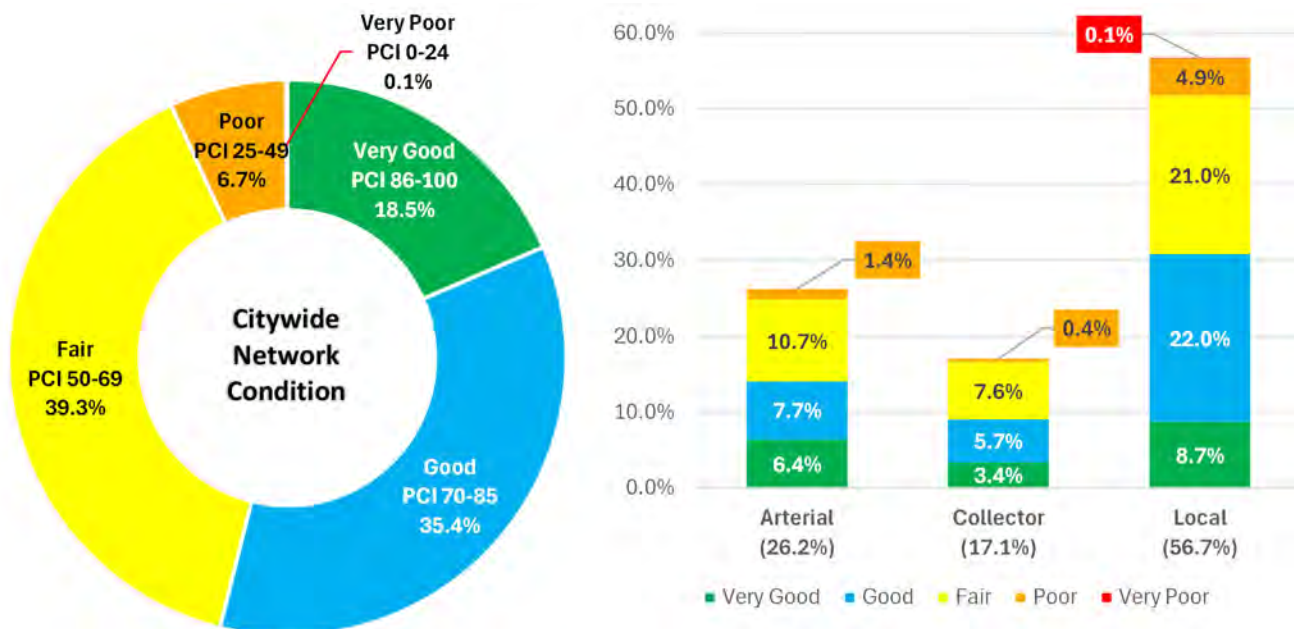

Figure 3. Street Network Percent Pavement Area by Condition Category.

Table 4 provides a pavement condition breakdown for the Citywide street network as well as the local, collector, and arterials street networks by PCI range and condition category. Approximately 18.5 percent (by area) of the street network is in "Very Good" condition. Approximately 35.4 percent are in "Good" condition, 39.3 percent in "Fair" condition, and 6.7 percent are in "Poor" condition, and 0.1 percent are in "Very Poor" condition.

Pavement Condition

Figure 4 illustrates PCI comparisons between the City of Corona and the surrounding agencies using information gathered from the 2022 California Statewide Local Streets and Roads Needs Assessment. The City's PCI of 71, placed the City's network in "Good" condition, which is in the middle compared to other nearby cities and above the 2022 statewide average of 65.

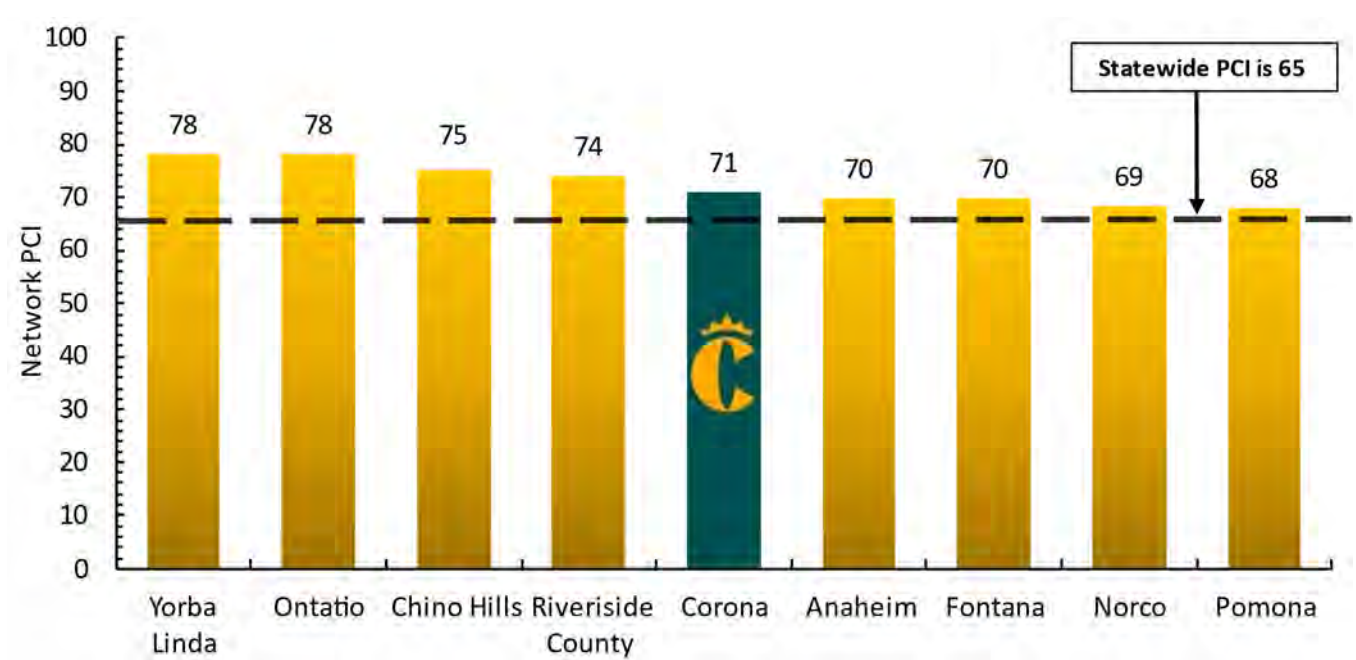

Figure 4. Network PCI for Different Agencies.

5 Maintenance and Rehabilitation Strategies

In general, surface treatments such as REAS or RPMS Type II slurry seals with crack sealing are used when the pavements are in “Good” to “Very Good” condition. This type of treatment is usually considered “preventive maintenance”. When the pavement condition deteriorates to lower levels, overlays and reconstruction need to be performed. These are considered “rehabilitation” or “reconstruction”. In addition, base repairs are commonly used as preparatory work prior to overlay and slurry seal treatments.

5.1 Decision Tree

In meetings with the City staff, a detailed M&R decision tree was prepared and included in Appendix B. This determined the most effective and realistic treatments for each group of streets by functional class and condition category.

Figure 5 below illustrates that pavement maintenance follows the old colloquial saying of “pay now or pay more later”. History has shown that it costs much less to maintain streets in good condition than to repair streets that have failed. By letting pavements deteriorate, streets that once cost \$0.40 per square foot to do a REAS/RPMS Type II Slurry (and crack seal) in a few years cost as much as \$12 per square foot to reconstruct.

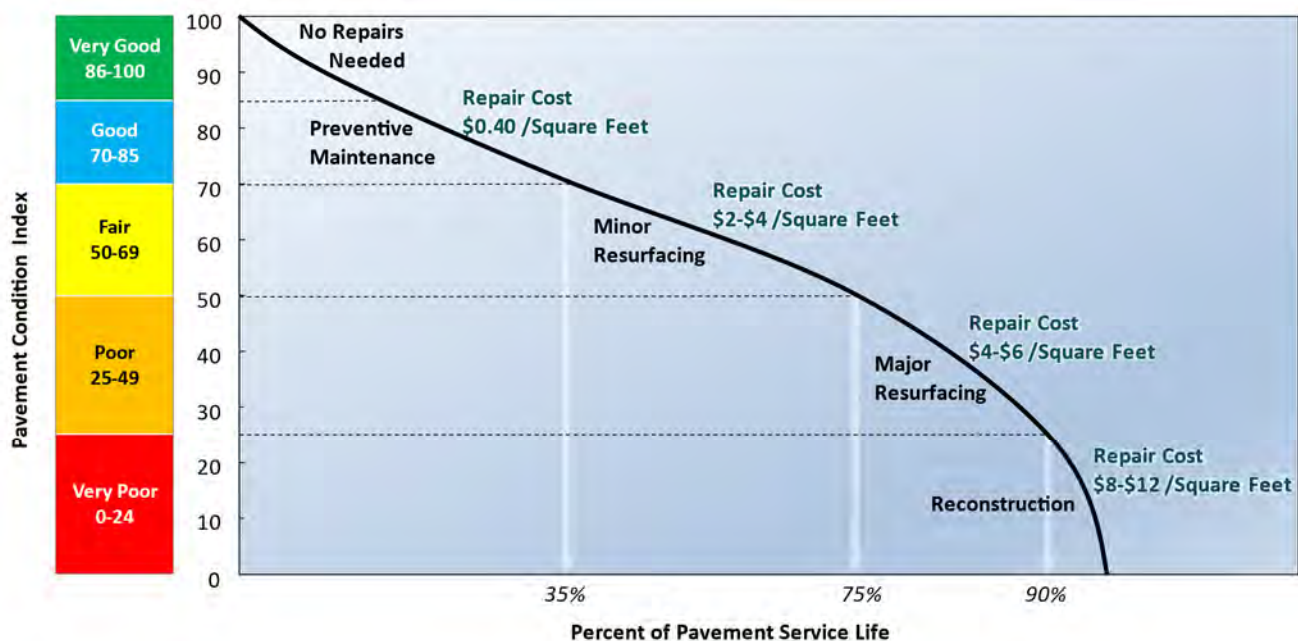

Figure 5. Costs⁹ of Maintaining Pavements Over Time

The costs shown in the above chart are based on recommendations and past bid tabs provided by the City. NCE met with the City on several occasions to refine and adjust the calculation and assumptions. The final costs were approved by the City and represent an estimate based on the best information currently available.

⁹ In addition to the contractor’s prices, unit costs are loaded to include staff time, design, construction management, contingencies, and all non-Asphalt Concrete (AC) related work.

The pavement deterioration curve shown by the black line in Figure 5 describes how pavements deteriorate over time. In general, arterials will be expected to have a service life of 20 years, while those for local streets may exceed 30 years.

Pavements in the “Good” condition show some form of distress that require more than preventive maintenance. At this point, a well-designed pavement will have reached between 35 and 50 percent of its life and pavement resurfacing or an overlay will be required. A key element of a pavement management repair strategy is to keep streets in the “Very Good” to “Good” categories from deteriorating. This is particularly true for streets in the “Good” range, since pavement deterioration will accelerate if left untreated.

For the pavements in the “Poor” category, approximately 30 percent of the pavement life is left, and a heavy resurfacing will be required — a thicker grind and overlay (3 to 5 inches). Pavements in “Very Poor” condition are near the end of their service life and often exhibit severe forms of distress such as potholes, rutting and extensive cracking, etc. At this stage, reconstruction is typically required. The reconstruction includes new asphalt over replaced aggregate base.

5.2 Treatment Unit Prices

NCE modeled an inflation rate of 5.0 percent for the 10-year analysis period for all budget scenarios. During 2021, COVID-19 disrupted the worldwide economy for several months, leading to the sudden inflation of prices and interest rates. The average inflation rate in the United States was 1.23 percent in 2020 and 4.7 percent in 2021 but increased to 8.0 percent in 2022. At the end of 2023, the estimated price of asphalt concrete has risen to \$110 per ton based on projections from construction bid tabs. Table 4 illustrates the prices for some paving items. These prices are inflated for 2025 (Year 1 of the 10-year analysis period).

Table 4. 2023 Paving Item Prices

Item	Unit	Unit Cost
HMA Type C2	TON	\$110.00
REAS Type II + Seal Cracks	SF	\$0.25
Cold Mill (2.0")	SF	\$0.20
Base Remove and Replace (6")	SF	\$1.64

According to the U.S. Bureau of Labor Statistics, the 12-month nationwide inflation rate for May 2024 for the Consumer Price Index was 3.4 percent, and California experienced more severe changes with 3.9 percent inflation. Modeling an inflation rate of 5.0 percent in the budget scenario analysis for this 2024 PMP report is a prudent and slightly conservative approach for several reasons:

1. Historical Trends

- a. **Recent Years:** In 2023, the inflation rate was 5.3 percent, and it decreased to 3.4 percent by May 2024. A 5.0 percent rate is comfortably above the recent 12-month rate of 3.4 percent, ensuring that the budget scenarios remain resilient to potential short-term fluctuations.

- b. **Previous Highs:** An inflation rate of 5.0 percent is conservative relative to historical peaks that have exceeded 5.0, 6.0, and even 7.0 percent in recent years.

2. Future Uncertainty

- a. **Economic Volatility:** Inflation rates can be unpredictable due to economic factors such as supply chain disruptions, geopolitical events, or changes in monetary policy. Using a 5.0 percent rate provides a buffer against unexpected increases in inflation.
- b. **Conservative Planning:** A slightly higher rate ensures that budgets are prepared for more significant cost increases than anticipated, reducing the risk of underestimating future expenses.

3. Policy Adjustments

- c. **Monetary Policy:** Central banks, including the Federal Reserve, may implement measures to stabilize inflation. While current trends suggest a decrease, there could be policy changes that might affect inflation rates, making a 5.0 percent rate a cautious estimate.

6 Planned Projects

The City provided NCE with maintenance and rehabilitation projects that consist of slurry seals and mill and overlays. Furthermore, the City has scheduled capital improvement projects (CIP) that include major roadways widening, replacing old sewer lines and updating water lines. With the assistance of the City, projects were selected so that these capital improvement projects will not overlap with the proposed M&R schedule of the 10-year PMP Plan. The planned projects (from Year 4 and 5 of the previous 5-year PMP) and the CIP that will take place during year 2024 to 2026 are shown in Figure 6. Appendix C shows a list of the planned project street sections.

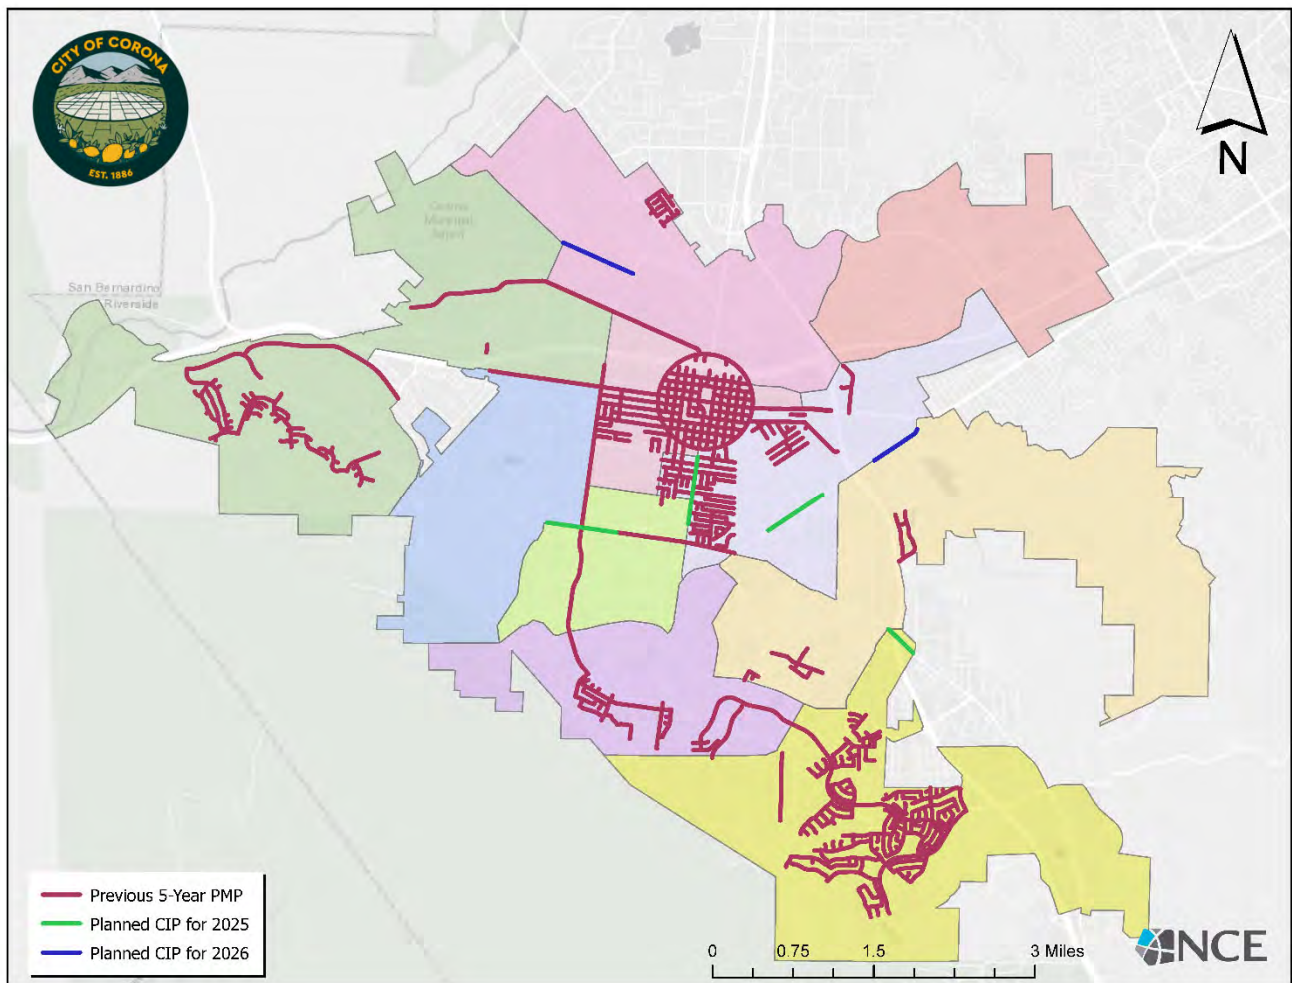

Figure 6. Planned Projects 2024 to 2026

7 Budget Analysis

Based on the principle that it costs less to maintain streets in good condition than it does to repair those that have failed, cost-effective PMPs employ strategies that eliminate the deferred maintenance and then maintain the network with on-going preventive maintenance. Such strategies bring the network condition to an optimal PCI that can be maintained over time.

7.1 Budget Needs

The first step in developing such a cost-effective strategy is to determine, assuming unlimited revenues (i.e., an unconstrained budget), the total maintenance budget “needs” of the network. In other words, the amount of funding required for each street in the network to achieve an optimal level based on the policy established in the decision tree. The costs of the treatment(s) over the analysis period were calculated by multiplying the unit cost by the pavement section area at an annual inflation rate of 5.0 percent (based on City recommendations).

This is estimated to be approximately \$192.1 million over the next 10 years. Of the total budget needs, approximately \$51.1 million (26.6 percent) is devoted to preventive maintenance, while the rest is allocated for more costly rehabilitation and reconstruction. If the City follows this “ideal” strategy, the Citywide average network PCI will increase to 84 by the end of 2034. Table 5 below shows the impacts of expenditures on the PCI, assuming an unconstrained budget. Note that this analysis does not include the planned CIP work and zone distribution.

Table 5. Summary of Results from an Unconstrained Needs Analysis (Network)

Year	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	Total
Total Budget Needs (\$M)	113.2	15.7	10.5	4.0	2.9	2.3	1.5	33.0	5.5	3.5	192.1
Rehabilitation (\$M)	107.1	14.7	10.2	1.5	0.1	0.0	1.1	4.3	1.2	0.8	141.0
Preventive Maintenance (\$M)	6.1	1.0	0.3	2.5	2.8	2.3	0.4	28.7	4.3	2.7	51.1
Treated PCI	91	89	88	87	85	84	83	86	86	84	NA
Untreated PCI	71	70	68	66	64	62	59	57	55	52	NA

In the unconstrained “budget needs” analysis, the PCI value for each street section is projected without treatment over the analysis period and assigned the applicable treatments. The appropriate time to apply treatments is also determined per the decision tree, since the pavement begins to deteriorate immediately after application and as a result, and subsequent preventive maintenance may be required. The streets in “Poor” and “Very Poor” conditions that require the more costly repairs will be among those chosen in the first year.

7.2 Budget Constraints

When budget analyses are run, StreetSaver® has an optimization model to choose projects that will provide the most cost-benefit solution given a specific budget. This optimization model will try to maximize the cost-benefit for the entire road network and may choose to select isolated road sections to maximize the benefits with the

available budget. The user is allowed to place constraints in the analysis, and some of these constraints used for the scenario analysis were as follows:

- Local and collector streets can be treated on years scheduled by their zone.
- Arterial street segments must be continuous and at least 0.5 miles in total centerline miles.

It is important to note that putting constraints into the model will not result in the best possible outcome. However, adopting this approach provides the City a more feasible alternative from a constructability viewpoint that can potentially reduce mobilization costs and save money.

7.3 Budget Scenarios

Having determined the maintenance needs of the street network, the next step in developing a cost-effective M&R strategy is to conduct several alternative budgets or “what-if” scenario analysis. By examining the impacts of budget “scenarios”, the advantages, and disadvantages of the 4 funding levels and maintenance strategies can be illustrated.

The following scenarios were performed for this report using an annual inflation factor of 5.0 percent. The budgeted amounts for the 4 scenarios reflect the total project costs including staff time, design, construction management, contingencies, and all non-Asphalt Concrete (AC) related work. The upcoming planned projects that will be constructed in 2024 is expected to increase PCI from 71 to 74 by the end of 2024. The following budget scenarios were performed as part of the report in conjunction with the upcoming project.

- **Scenario 1: City’s Existing Funding (\$9.8M to \$13.2M per year)** – At the City’s current funding level of \$114.0 million, the network PCI is projected to increase from 71 to 74 by the end of year 2025, and then will decrease from 74 to 69 by the end of 2034. The deferred maintenance will increase from \$113.2 million to \$202.0 million by the end of 2034.
- **Scenario 1B: Worst Streets First (\$9.8M to \$13.2M per year)** – The goal of this scenario is to minimize the percentage of pavements in ‘Very Poor’ condition using the City’s existing funding. Compared to Scenario 1, streets are selected for treatment based on their condition rather than the cost-effectiveness of their treatment. The results show that PCI drops to 68 and deferred maintenance increases to \$194.5 million by the end of 2034.
- **Scenario 2: Maintain Minimum 71 PCI (\$11.2M to \$15.0M per year)** – The result shows that the City will need to spend a total of \$130.0 million over the next 10 years (approximately \$13.0 million per year) to maintain the network at a minimum PCI of 71. Additionally, deferred maintenance will increase from \$113.2 million to \$181.5 million by the end of 2034.
- **Scenario 3: All Streets that Need Treatment (\$19.0M to \$23.0M per year)** – This scenario will require approximately \$10.0 million annually in addition to existing funding, that is a total of \$199.0 million over the next 10 years. The City will be able to increase the PCI from 71 to 80 by the end of 2034. The deferred maintenance will decrease to \$76.0 million by the end of 2034.

The budget scenarios are presented in the following subsections. Maps illustrating the current pavement condition and the projected 2034 pavement condition for each scenario are provided in Appendix D.

7.4 Scenario 1: City's Existing Funding (\$9.8M to \$13.2M per year)

At the City's current budget with an average of \$11.4 million per year, the network PCI will decrease from 71 to 69 over the 10-year analysis period. On average, 9.0 percent of the budget is allocated to preventive maintenance while 91.0 percent to rehabilitation. By the end of 2034, 15.5 percent will be in "Very Good" condition, 55.5 percent in "Good" condition, 11.0 percent in "Fair" condition and approximately 10.5 percent will be in "Poor" and 7.5 percent will be in "Very Poor" condition. The deferred maintenance will increase from \$113.2 million to \$202.0 million by the end of 2034. Table 6 and Figure 7 show the results of this scenario.

Table 6. Summary of Results from Scenario 1 Analysis

Year	Current	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	Total
Budget (\$M)	N/A	9.8	10.1	10.5	10.8	11.2	11.5	11.9	12.3	12.7	13.2	114.0

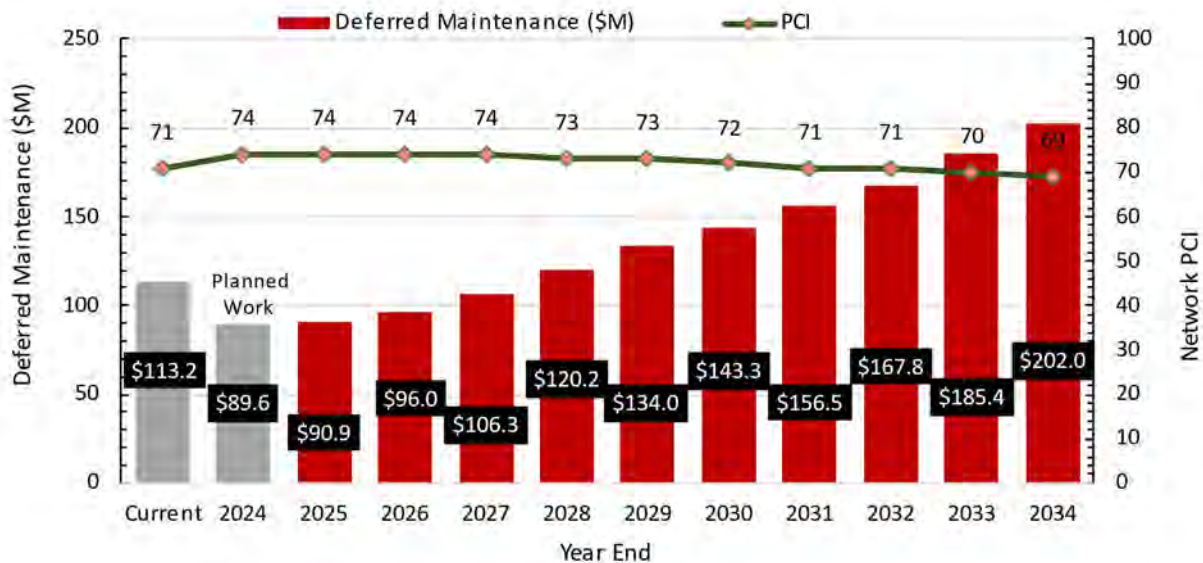

Figure 7. PCI vs Deferred Maintenance for Scenario 1

7.5 Scenario 1B: Worst Streets First (\$9.8M to \$13.2M per year)

An alternative analysis was performed with the City's existing budget where the worst sections were treated first. In contrast to Scenario 1 that selected sections for treatment based on cost-effectiveness, this scenario prioritizes sections in "Poor" or "Very Poor" condition. Excess funds that were not sufficient for rehabilitation were used for preventive maintenance. On average, only 2.5 percent of the budget was allocated to preventive maintenance. The results showed that the network PCI at the end of 10 years would be 68. Table 7 and Figure 8 show the results of this scenario. Compared to Scenario 1, the 'Worst First' scenario is 1 PCI point lower by the end of 2034 and deferred maintenance is lower by \$7.5 million.

Table 7. Summary of Results from Scenario 1B Analysis

Year	Current	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	Total
Budget (\$M)	N/A	9.8	10.1	10.5	10.8	11.2	11.5	11.9	12.3	12.7	13.2	114.0

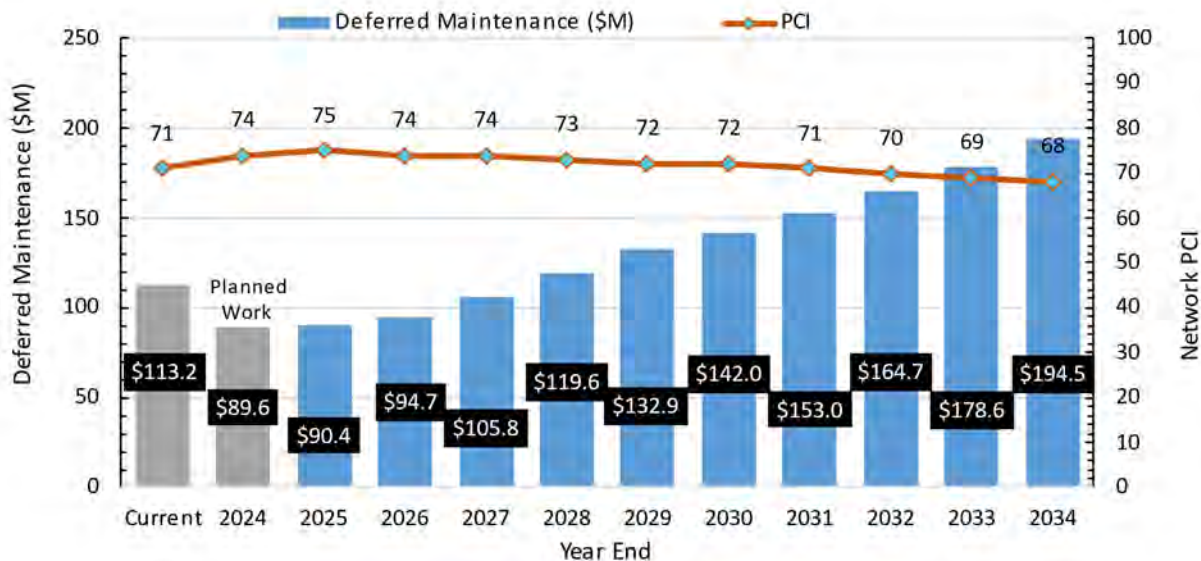

Figure 8. PCI vs Deferred Maintenance for Scenario 1B

7.6 Scenario 2: Maintain Minimum 71 PCI (\$11.2M to \$15.0M per year)

This scenario aims to maintain the overall network at or above PCI of 71 by increasing the current budget. As shown in Table 8 and Figure 9, the estimated financial commitment required to accomplish this goal is \$130.0 million over the 10-year analysis period. While the network PCI is maintained above 71, the deferred maintenance will increase from \$113.2 million to \$181.5 million by the end of 2034. This scenario will result in 16.7 percent of the network being in “Very Good” condition, 57.9 percent in “Good” condition, 9.9 percent in “Fair” Condition, and 9.1 percent in “Poor” condition and 6.4 percent “Very Poor” condition. Furthermore, 63.0 percent of the roads needing treatment will be treated. Sections selected for treatment are provided in Appendix E and maps by year are provided in Appendix F for this scenario.

Table 8. Summary of Results from Scenario 2 Analysis

Year	Current	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	Total
Budget (\$M)	N/A	11.2	11.6	11.9	12.3	12.7	13.2	13.6	14.0	14.5	15.0	130.0

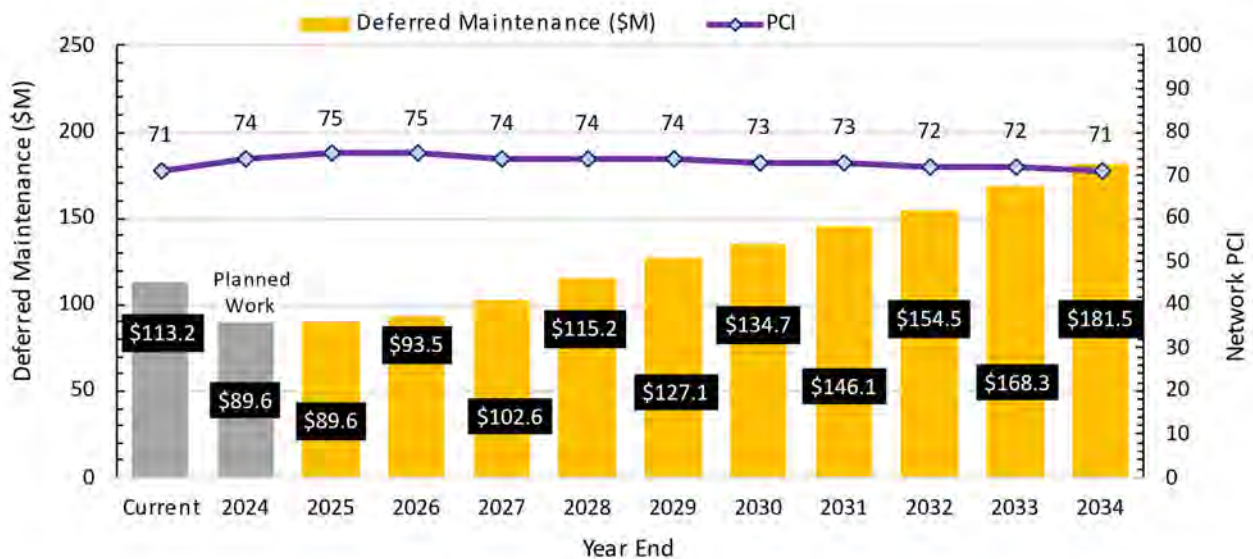

Figure 9. PCI vs Deferred Maintenance for Scenario 2

7.7 Scenario 3: All Streets that Need Treatment (\$19.0M to \$23.0M per year)

The goal of this scenario is to treat all streets that need treatment for each zone over the next 10 years. As shown in Table 9 and Figure 10, the estimated financial commitment required to accomplish this goal is \$199.0 million over the 10-year analysis period. The amount of money allocated to rehabilitation is about 94 percent and 6 percent allocated to preventive maintenance. This scenario will result in 18.8 percent of the network being in “Very Good” condition, 69.2 percent in “Good” condition, 9.5 percent in “Fair” condition and 2.5 percent in “Poor” condition. The deferred maintenance will decrease to \$76.0 million by the end of 2034. This scenario will treat 100 percent of the road sections that require treatment.

Table 9. Summary of Results from Scenario 3 Analysis

Year	Current	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	Total
Budget (\$M)	N/A	19.0	20.0	21.0	23.0	22.0	18.0	16.0	18.0	23.0	19.0	199.0

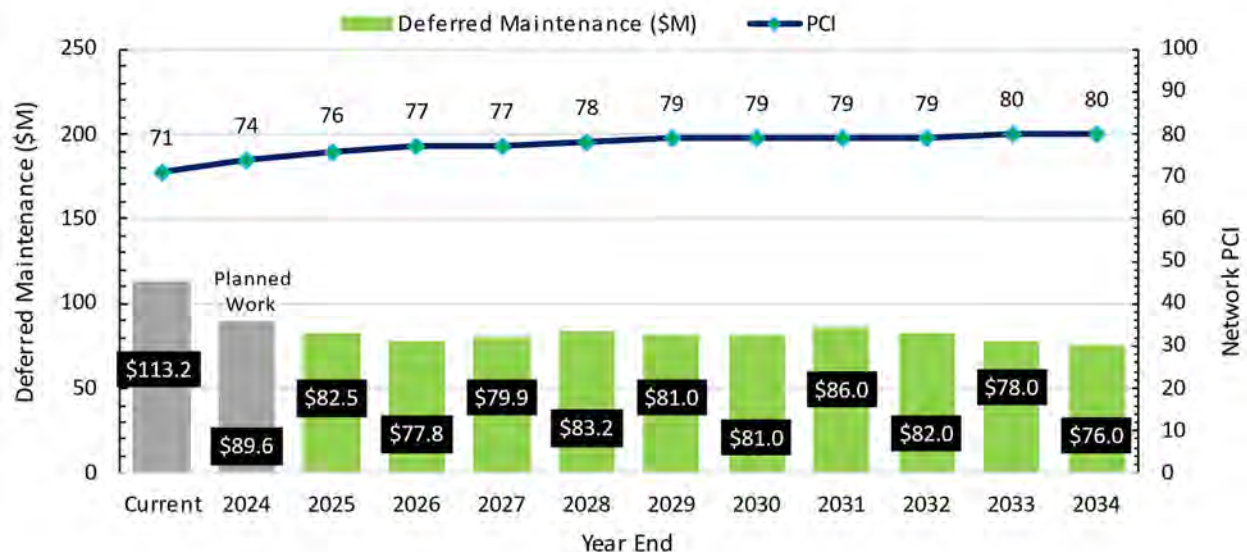

Figure 10. PCI vs Deferred Maintenance for Scenario 3

8 Scenarios Comparison

Figure 11 compares the annual changes in PCI for each of the scenarios. As mentioned before, the PCI will decrease to 69 and 68 in Scenarios 1 and 1B, respectively, while Scenario 2 will maintain the PCI at 71 by the end of 2034. The best approach is Scenario 3 where PCI will increase to 80 by the end of 2034.

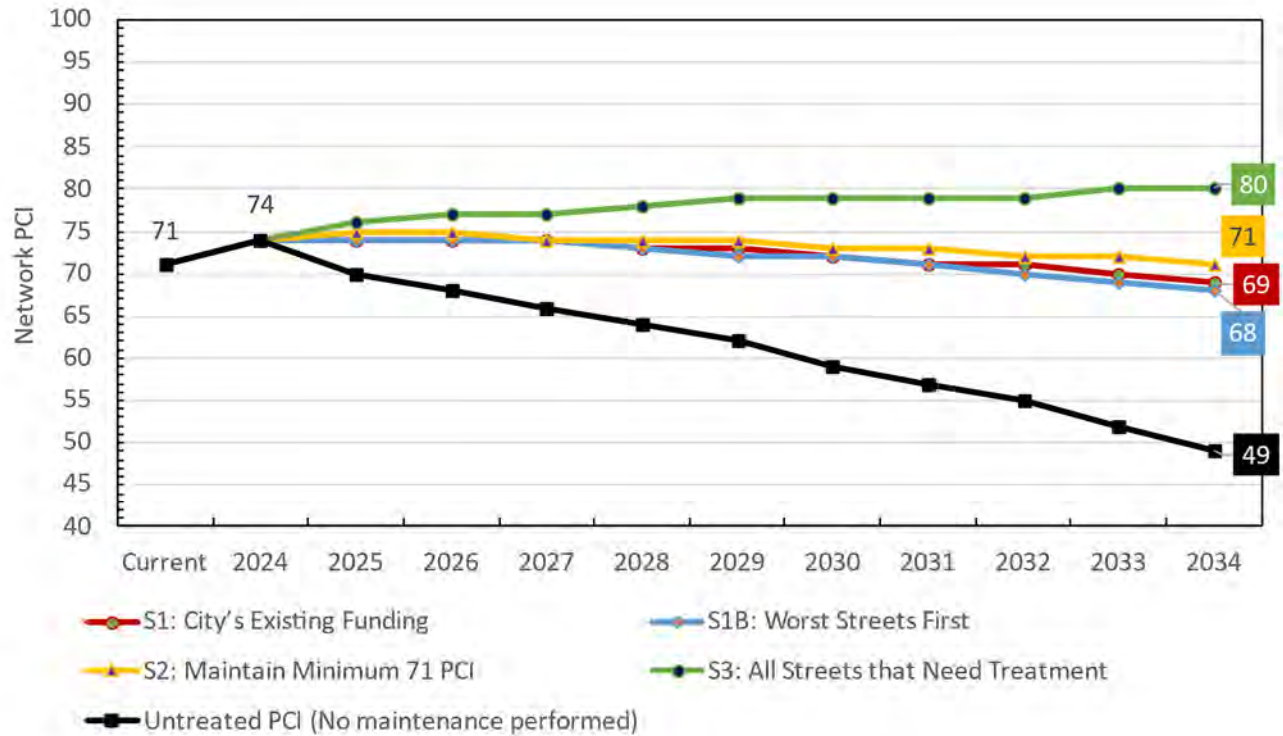

Figure 11. Comparison of Annual PCI by Scenario

Table 10 shows a summary of centerline miles and the total area treated by each of the scenarios. Scenario 1 only treats 75 percent of streets that need treatment, Scenario 1B treats 41 percent, Scenario 2 treats 79 percent, and Scenario 3 treats 100 percent.

Table 10. Summary of Number of Miles and Area Treated by Each Scenario

Scenario	Description	Centerline Miles	Pavement Area (SF)
1	City's Existing Funding	225.6	46,810,937
1B	Worst Streets First	117.1	25,866,270
2	Maintain Minimum 71 PCI	241.2	49,758,352
3	All Streets that Need Treatment	293.6	62,745,646

Figure 12 illustrates the changes in deferred maintenance over the 10-year analysis period for each scenario. For Scenarios 1, 1B, and 2 the deferred maintenance will increase to \$202 million, \$194.5 million, and \$181.5 million, respectively. Scenario 3 will decrease the deferred maintenance to \$76.0 million by the end of 2034.

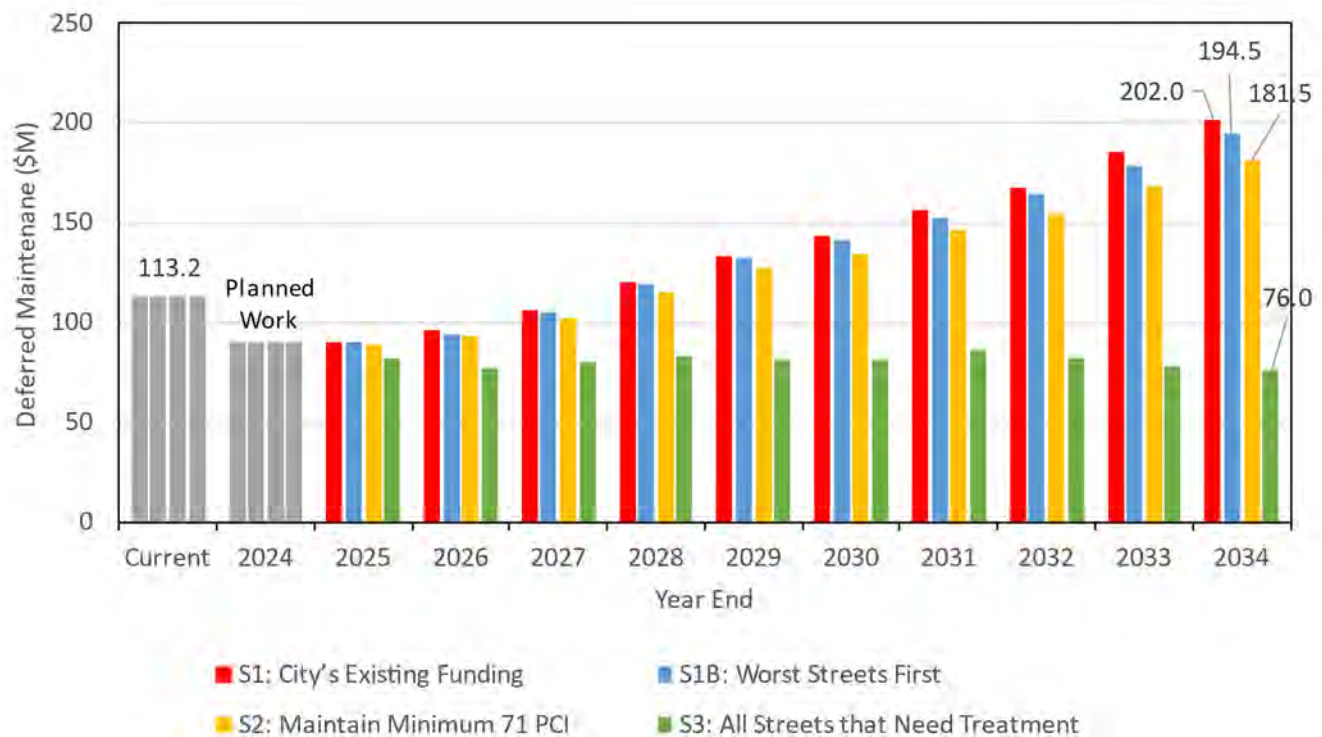

Figure 12. Comparison of Annual Deferred Maintenance by Scenario

Figure 13 illustrates the percent change in pavement condition for each scenario at the end of 2034. As noted previously, currently, 53.9 percent of the network is in “Very Good” or “Good” condition, 39.3 percent in “Fair” condition, and 6.8 percent in either “Poor” or “Very Poor” condition.

Scenario 1 – the portion of the network in “Very Good” or “Good” condition will increase to 71.0 percent, the portion in “Fair” condition will decrease to 11.0 percent, and the portion in “Poor” or “Very Poor” condition will increase to 18.0 percent.

Scenario 1B – has a similar percentage of pavements in “Very Poor” or “Poor” condition as Scenario 1 at 17.8 percent. However, there are less pavements in “Very Good” or “Good” condition—56.6 percent—and more pavements in “Fair” condition at 25.6 percent.

Scenario 2 – will have 74.6 percent of the network in “Very Good” or “Good” condition, 9.9 percent in the “Fair” condition and 15.5 percent will be in either “Poor” or “Very Poor” condition by the end of 2034.

Scenario 3 – this would be the best scenario with 88.0 percent of the network in the “Very Good” or “Good” condition, 9.5 percent in “Fair” condition, and 2.5 percent in the “Poor” condition. Scenario 3 will eliminate all the streets under the “Very Poor” condition.

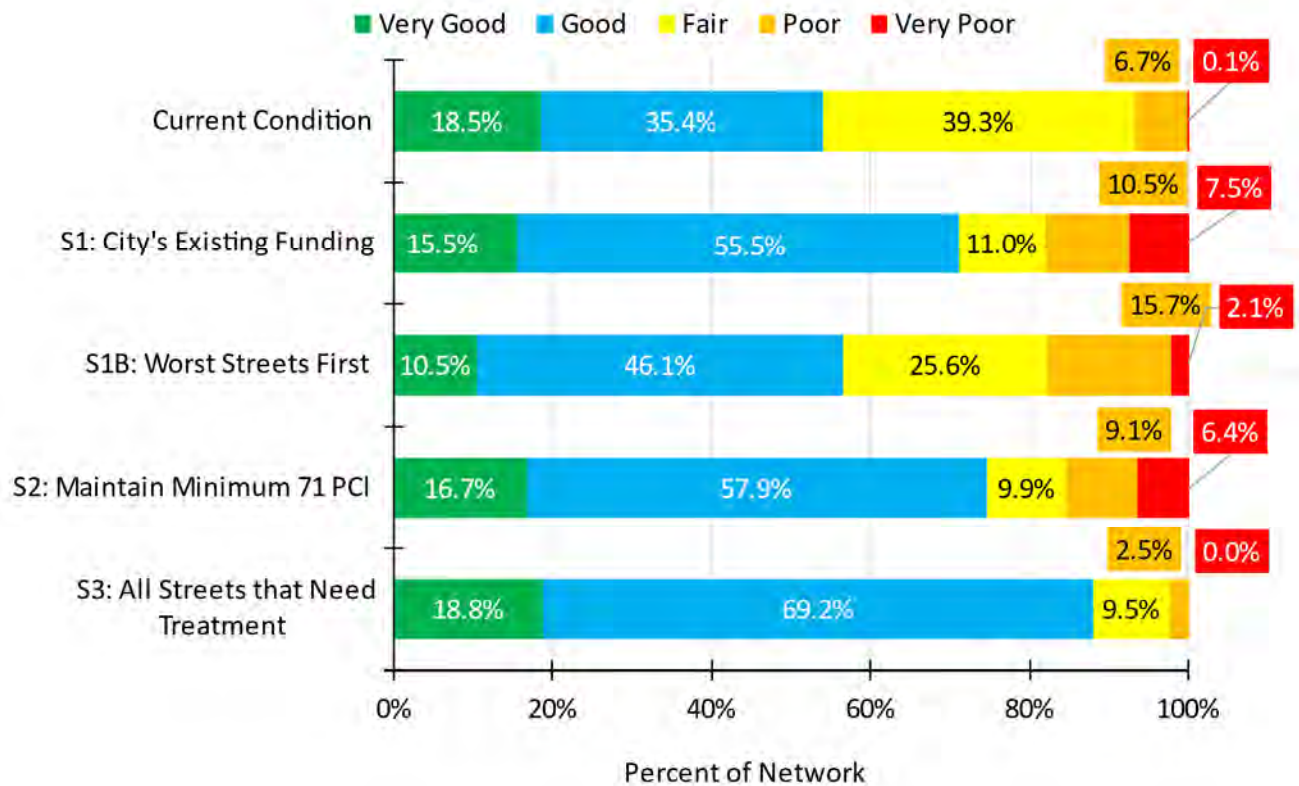

Figure 13. Comparison of Pavement Condition by the End of 2034 – Breakdown by Scenarios

Please note that in Scenarios 1, 2 and 3 where streets are chosen based on cost-effectiveness, the percentage of pavement in “Fair” condition is reduced (PCI between 69 and 50). This is condition distribution promotes preventive maintenance, where the percentage of pavements closest to the critical PCI of 55 is reduced. As mentioned previously, treating pavements close to the critical PCI of 55 reduces the pool of pavements that may deteriorate to “Poor” or “Very Poor” conditions in the future. As seen in Figure 12, Scenario 1B has lower deferred maintenance than Scenario 1, by the end of the analysis period—mostly because the percentage of pavement in “Very Poor” condition, requiring reconstruction, is lower. However, Scenario 1B has a greater percentage of pavement in “Fair” or “Poor” that may deteriorate to “Very Poor” in future if funding is not sufficient.

9 Conclusions and Recommendations

In summary, the City of Corona has a substantial investment of \$749.9 million in the pavement network. Overall, the pavement network is in “Good” condition with a PCI of 71. Approximately 18.5 percent of the network is in “Very Good” condition, 35.4 percent in “Good” condition, 39.3 percent in “Fair” condition, and 6.7 percent is in “Poor”, and 0.1 percent in “Very Poor” condition. 10 PMP Zones were created for the City’s 10-year PMP Plan, which addresses local and collector roads in each zone, while allocating about 20 percent of the budget for arterials each year.

9.1 Recommendations

Based on the data collected and the scenarios analyzed and presented in this report, NCE offers the following recommendations.

1. **Funding** - NCE recommends that the City increase the funding level to improve the network condition and decrease deferred maintenance. Scenario 3 accomplishes both these objectives by gradually increasing PCI from 71 to 80 and decreasing the deferred maintenance from \$113.2 million to \$76.0 million by the end of 2034. However, because Scenario 3 requires a substantial financial commitment, **NCE recommends the City pursue Scenario 2** and maintain a minimum PCI of 71. NCE recommends that the City increase annual funding by \$2.5 million per year to achieve this goal.
2. **Additional Funding** - To address the gap between the City’s existing funding and the recommended scenario, NCE recommends the City take full advantage of all RMRA and Measure A funds and actively pursue additional pavement funding sources if feasible. Some potential funding sources are listed below:

Federal Funding Sources

- o American Rescue Plan Act (ARPA)
- o Community Development Block Grants (CDBG)
- o Congestion Mitigation and Air Quality Improvement Program (CMAQ)
- o Federal Emergency Management Agency (FEMA)
- o Highway Safety Improvement Program (HSIP)
- o Bipartisan Infrastructure Investment and Jobs Act (IIJA)
- o Surface Transportation Program (STP)
- o Secure Rural Schools and Community Self-Determination Act

State Funding Sources

- o Active Transportation Program (ATP), which now includes the Bicycle Transportation Account (BTA) and Safe Routes to Schools (SR2S)
- o AB 2766 (vehicle surcharge)
- o CalRecycle grants
- o State Transportation Improvement Program (STIP)
- o State Water Resource Control Board
- o Transportation Development Act (TDA)
- o Traffic Safety Fund
- o Transportation Uniform Mitigation Fee (TUMF)

- o Vehicle License Fees (VLF)

Local/Regional Funding Sources

- o Development impact fees
- o Flood Control Districts
- o General funds
- o Local sales tax measures
- o Parcel/property taxes
- o Solid waste funds
- o Traffic impact fees
- o Traffic safety/circulation fees
- o Transportation mitigation fees
- o Transient Occupancy Taxes (TOT)
- o Underground impact fees
- o Utilities (e.g., stormwater, water, wastewater enterprise funds)
- o Various assessment districts (lighting, maintenance, flood control, community facilities)
- o Vehicle registration fees
- o Vehicle code fines

3. Pavement Maintenance Strategies

- a. NCE recommends that the City consider alternative treatments such as Full-depth reclamation (FDR) or Cold-in-place (CIR) or cold central plant recycling (CCPR) which are alternatives to reconstruction and conventional overlays. These treatments could potentially offer cost savings of approximately 20 to 30 percent compared to traditional treatments.
 - b. NCE recommends that the City adopts a well-funded preventive maintenance program with rehabilitation projects to improve pavements currently in poor condition. This is necessary to at least maintain the portion of the street network that is in good condition and avoid increasing the deferred maintenance.
4. **Inspection Strategies** - To monitor future pavement performance and on-going maintenance needs, the City should carry out a pavement condition assessment every 2 to 3 years.
 5. **M&R Decision Tree** - NCE recommends that the City annually review and update the M&R treatment strategies and associated unit costs to reflect current construction techniques and changing costs. This will ensure that the results for the budget analyses are reliable and as accurate as possible.

The budget scenarios assessed in this PMP Update depend on existing data and assumptions derived from historical trends and predictive pavement performance models and indices. Unexpected events like supply chain issues, new developments in pavement technology, extreme weather, issues related to construction, and funding gaps can affect the projected results of the budget scenario analysis. NCE advises the City to remain flexible and adjust to such disruptions in the 10-year PMP Plan.

Appendix G-1 Resume of Field Inspectors

1 Introduction

The need for quality control is paramount when performing data collection in any field, as it is essential for accurate planning, analysis, and design. NCE's Quality Assurance Management Plan (QAMP) affirms that:

NCE is dedicated to achieving technical and management excellence and to delivering professional engineering and environmental services that meet or exceed our clients' needs. NCE's Quality Assurance/Quality Control (QA/QC) Program is designed to achieve these goals. This QA Management Plan (QAMP) describes NCE's QA Program, which is based on four principles: client satisfaction, employee participation, problem prevention, and continuous quality improvements.

NCE's QAMP establishes minimum quality standards for performance and procedures to ensure our clients receive quality service. It requires the participation of employees at every level. It encourages project managers and technical staff to take pride in their work and assume responsibility for ensuring that the job is done correctly the first time. The QAMP is designed to reduce the incidence of quality-related and, where necessary, results in corrective actions and modification of work procedures to minimize the incidence of future problems.

NCE has also prepared detailed and specific quality control plans (QCPs) for projects; the most notable example is for the **Long-Term Pavement Performance (LTPP) – Western Regional Support Contract** for the Federal Highway Administration. This is a 150-page document that covers data collection on highways, including deflection, profile, pavement distresses, traffic, maintenance and rehabilitation history, materials testing and sampling, and document control.

1.1 Objectives

This document constitutes a formal QCP for the City of Corona. It was prepared in January 2024. The QCP focuses on data collection issues as part of the pavement management update. Specifically, it is intended for the 2023/24 Pavement Management Update. The focus is on the collection of network-level pavement distress data. As defined by the National Cooperative Highway Research Program Synthesis 401 Quality Management of Pavement Data Collection, "Network-level data collection involves the collection of large quantities of pavement condition data, which is often converted to individual condition indices or aggregated into composite condition indices."

1.2 Structure

The following components are addressed in this QCP:

- Condition inspection procedures used
- Accuracy required for data collection
- Inspector qualifications and experience
- Safety procedures.

2 Quality Control Plan

2.1 Condition Inspection Procedures

The governing document for performing condition surveys for the City of Corona is ASTM D6433, “Standard Practice for Roads and Parking Lots Pavement Condition Index (PCI) Surveys.” Both asphalt concrete (AC) and Portland Cement Concrete (PCC) pavements are included in this protocol. The following distresses are collected for each pavement type.

AC Pavements	PCC Pavements
1. Alligator (fatigue) cracking 2. Bleeding 3. Block cracking 4. Bumps and sags 5. Corrugation 6. Depression 7. Edge cracking 8. Joint reflection cracking 9. Lane/shoulder drop-off 10. Longitudinal and transverse cracking 11. Patching and utility cut patching 12. Polish aggregate 13. Potholes 14. Railroad crossing 15. Rutting 16. Shoving 17. Slippage cracking 18. Swelling 19. Raveling 20. Weathering	1. Blowup/Buckling 2. Corner Break 3. Divided Slab 4. Durability Cracking 5. Faulting 6. Joint seal damage 7. Lane/shoulder drop-off 8. Linear cracking 9. Patching, large and utility cuts 10. Patching, small 11. Polished aggregate 12. Popouts 13. Pumping 14. Punchout 15. Railroad crossing 16. Scaling, map cracking, and crazing 17. Shrinkage cracks 18. Spalling, corner 19. Spalling, joint

Any exceptions to the ASTM procedures will be discussed with the City before any inspections are performed. Exceptions are usually related to distresses or situations that are not covered in the manuals. Examples include slippage cracks, roller checkmarks, or edge cracking on streets with no curbs and gutters. Others include the raveling of surface seals or surveying the open-graded AC mixes. Any modifications will be documented and submitted to the City for approval.

All distress or condition inspections are performed as semi-automated inspections, and the entire pavement is inspected. Field crews are typically composed of a two-person crew traveling in a van. The crew will collect and record visual distresses using equipment installed in the van.

The data will be summarized into sample units and entered into the StreetSaver® database. The size of the sample unit will be 2,500± 1,000 square feet as per ASTM D6433 protocols. In addition, the sample units will match the existing management sections set up in the StreetSaver® database. Before the inspection begins, the NCE team will perform two Field QC Steps. These are outlined as follows:

Step 1: Calibration

The first step in this process is having NCE's field technician and Marker Geospatial field manager meet in the field, drive a few roads, and review various pavement conditions in the City of Corona. This is a valuable exercise to calibrate or synchronize the team's view of the various distresses and ensure a consistent product.

Step 2: Quality Control

The QC team independently reviews the pavement condition data collected on the City's pavement network. Since semi-automated distress data collection differs from the walking protocols, this is required to ensure that the collected pavement data is consistent with those protocols.

Up to 20 pavement sites were selected for quality control purposes. They included a range of:

- Functional Classifications
- Pavement condition or age

An independent NCE technician will select the 20 sites and perform a detailed walking inspection. The semi-automated team will then perform a blind test on these sites and compare the results.

Acceptability Criteria

The types and severities of the distress must be the same and quantities within ±10% of each other. If corrections are required on more than 10% of the calibration sites, then four additional sites will be selected and compared. This will continue until more than 95% of the calibration sites meet the acceptability criteria.

2.2 Accuracy Required for Data Collection

The accuracy required for data collection has two components, both of which are further described in the following paragraphs.

- Re-inspections
- PCI comparisons with past inspections

2.2.1 Re-Inspection “Check”

At least 5% of all inspections are randomly re-inspected by other team members. A different inspector will review these sites and determine the revised pavement distress measurements. If the initial inspection is determined to be inaccurate, the original inspector is given refresher training before being allowed to continue with any further inspections. Should the data be inaccurate for a particular day, all the data for that day will be re-inspected following refresher training to ensure accuracy.

Acceptability Criteria

At the time of re-inspection, the actual distresses will be re-inspected and verified, and any corrections will be made, if necessary. Distress types and severities must be the same, and re-measured quantities must be within $\pm 10\%$ of the original measured quantity.

If corrections are required on more than 10% of the re-inspected sample units, then an additional 5% will be re-inspected. This will continue until more than 95% of the re-inspected sections meet the acceptability criteria.

2.2.2 PCI Comparisons with Past Inspections

As another level of quality control, the new PCIs are compared with the previous PCIs. These sections are automatically flagged for further investigation if they differ by more than ± 10 PCI points.

If PCI increases 10 points

The section is investigated to see if a maintenance and rehabilitation event has occurred since the last inspection but which has not been recorded. This can only be resolved with feedback from the City. Typically, it may include activities such as:

- Crack sealing activities – changes medium or high severity cracking to low severity
- Patching activities - alligator cracking that has been removed and patched so that the resultant PCI is increased.
- Surface seals
- Overlay

Therefore, an up-to-date maintenance and rehabilitation history file in the StreetSaver® database is desirable, both for historical accuracy as well as to provide additional quality control.

If PCI decreases 10 points

The section is checked to see if the average deterioration rate (usually 3 to 4 points per year) is exceeded. No further action is required if the drop in PCI is within the acceptable range. If the drop exceeds the acceptable range, a re-inspection will be performed. The default performance curves in the pavement management software form the basis for acceptability.

2.3 Inspector Qualifications and Experience

All NCE's inspectors are required to attend formal training on condition distress inspections. For example, any of NCE's inspectors working on the LTPP project are required to attend a week-long training workshop every year to maintain their certifications. The Regional Transportation Commission (RTC) of Washoe County requires inspectors to be calibrated prior to performing any work using the ASTM D6433 protocols (also known as the pavement management inspections).

For pavement management (or ASTM D6433) inspections, NCE's technicians underwent the Orange County Transportation Authority technician prequalification exercise held in January 2022/2023.

Similarly, in agencies that use the StreetSaver® system, NCE's inspectors attend the distress training conducted by the Metropolitan Transportation Commission (MTC). After the formal training, technicians work with an experienced inspector before they are allowed to work on their own. Within the first month of working independently, up to 20% of their work is checked weekly. Any necessary corrections are made immediately.

Finally, NCE conducts a one-day training and calibration workshop annually for all NCE staff involved with data collection. The following table lists the inspectors assigned to this project and their most recent training date.

Inspector Name	Date of Distress Training	Training Conducted by
Joseph de Leon	December 15, 2023	Mei-Hui Lee
Franc Escobedo	December 15, 2023	Mei-Hui Lee
Jonathan Moore	December 15, 2023	Mei-Hui Lee

Resumes of technicians utilized on this project are included in Appendix G-1.

3 Safety Procedures

NCE administers a health and safety program in compliance with the Nevada Occupational Safety and Health Act (Section 618.383) and California Occupational Safety and Health Administration (OSHA) Title VIII, Section 3203. The program is documented in NCE's Workplace Safety Program Manual, which can be provided upon request.

Generally, the safety procedures include:

- Inspectors wear a Class 2 safety vest at all times.
- Flashing beacons are placed on all vehicles utilized for inspections.
- Stopped vehicles are to be parked at locations away from moving traffic (nearby parking, shoulders, etc.).
- For streets with higher volumes of traffic, inspectors usually use the sidewalk and move in the face of traffic when conducting the survey. This will give them more time and better chances of escaping a dangerous situation involving incoming vehicles.

On streets where there is a high volume of traffic or high speeds, additional measures may be necessary, such as:

- Inspections occur during off-peak periods or on weekends.
- An additional inspector attends to watch out for traffic.
- Traffic flaggers are provided in extreme cases.

In extreme cases where walking on the pavement surface is impossible, inspections will be performed from sidewalks or raised medians. However, this is extremely rare for city or county roads/streets; this is most often encountered on state highways, and lane closures are the most likely option in that circumstance.

All NCE inspectors are required to take online safety programs annually as administered by "Click Safety." These classes include:

- Work zone Traffic Safety Tips for Construction.
- Cal Heat Illness Prevention for all Industry Workers.
- Cal Person Protective Equipment for Construction.

Appendix G-1

Resume of Field Inspectors

Appendix G-1 Resume of Field Inspectors

Franc Escobedo – Senior Field Technician

Franc has more than 22 years of experience as a pavement management technician for NCE. He has performed numerous pavement condition inspections throughout California, Idaho and Washington. His experience includes distress collection across various pavement management systems, including the Metropolitan Transportation Commission StreetSaver®, PAVER™, Cartographs, and Hansen systems. Additionally, Franc has completed both the OCTA PAVER™, and MTC “Distress Identification” courses for both asphalt concrete and portland cement pavements and now assists with the training of agency staff on both courses.

Franc performs all activities relating to pavement data collection using hardcopy forms or tablets. As part of the quality control process, he performs cross-checks of data in the PMS database. He regularly performs quality control checks of field collected data and pavement maintenance history to ensure that PMS databases are accurate and up-to-date. During this process, he generates detailed reports that are necessary to perform his cross-checks of the collected data.

Representative Projects

County of Orange Program Management System Updates *Orange County, CA*

Engineering Technician. Pavement distress surveyor. Scope includes verifying the road inventory for a road network (674 centerline miles), surveying the roads using ASTM D6433-11 protocols, updating the maintenance history, developing maintenance strategies, performing multiple budget scenarios, linking to a GIS shapefile, developing a seven-year work plan, and preparing reports. Concurrent with the pavement condition survey, mobile data collection units gathered high-resolution 360-degree geo-referenced right-of-way street level digital imagery along with 3D point cloud data. Assets collected included markings, signs, curb ramps, signals, and drainage features. Work provided from 2009-2020. Project cost: \$2.3 million.

As-Needed Pavement Condition Survey Services, APE15117

City and County of San Francisco, CA

Engineering Technician. Pavement distress surveyor. Since 2016, NCE performed condition surveys on almost 1,000 centerline miles of streets. A particular challenge in 2016 and 2017 was the change in distress protocols when weathering and raveling were split into two different distresses; this resulted in an increase of the PCI, further confirmed by a research study. Project cost: \$868,796.

Pavement Management System Updates *City of Berkeley, CA*

Engineering Technician. Pavement distress surveyor. NCE is updating StreetSaver® and providing a five-year paving plan for 2018 – 2022. For the first four years the City will select streets for treatment based on criteria identified under Measure M. Project cost: \$49,900.

Pavement Management Update

Sonoma County, CA

Engineering Technician. Pavement distress surveyor. The scope included updating existing pavement management system annually, developing pavement treatment strategies, conducting budgetary analysis, and providing non-pavement needs assessment. Project cost: \$823,981.

As-Needed Pavement Engineering Services, San Francisco International Airport (SFIA)

City and County of San Francisco, CA

Engineering Technician. Pavement distress surveyor. Since 2011, NCE has provided on-call pavement consultant services on a very complex airfield environment under tight security, conducted forensic analysis on the PCC apron areas, and implemented the PAVER™ PMS. NCE performed the pavement designs for Runway 10R-28L, Plot 40, and Plot 12, determined the structural adequacy and performed mechanistic pavement designs using FAARFIELD for Runways 1L/19R and Taxiways E, F, and L. Determined the ACN/PCN for all runways and taxiways. NCE conducted forensic analysis on a new taxiway exhibiting premature large-scale reflective block cracking and rutting at Boarding Area A and dimpling of Taxiways B and M. NCE designed a high stability asphalt concrete mix to solve this problem. Updated the PAVER™ Airport PMS and performed automated distress surveys as per ASTM D5340. Digital images were collected, and the information was used to update SFIA's GIS and asset management system. Prepared final reports on the funding and maintenance needs for the next 20 years for the Federal Aviation Administration. NCE is currently providing similar pavement services to SFIA as a subconsultant through 2022. Project cost: \$1.2 million.

Appendix G-1 Resume of Field Inspectors

Joseph DeLeon – Senior Field Technician

Joseph joined NCE in 2017 as a pavement management technician and is experienced in collecting distress data for pavement management systems. Apart from conducting field inspections, he has performed all functions related to data collection and is an active participant in the quality control process. As part of this process, he performs cross-checks of data in the PMP database. Joseph has performed quality control checks of field collected data and pavement maintenance history to ensure that PMP databases are accurate and up-to-date. During this process, he generates detailed reports, needed to help perform his cross-checks of the data collected.

Representative Projects

Automated Survey / Control Sections

City of San Clemente, CA

Field Technician. Drove automated rig to conduct automated survey on residential roads and arterials in San Clemente, followed by inspection of control sections.

Orange County Automated Survey

City of Dana Point, County of Orange, CA

Field Technician. Drove automated rig to conduct automated survey on residential roads and collectors in Dana Point, Las Flores, North Tustin and Rossmoor.

Automated Survey / Control Sections

City of Manhattan Beach, CA

Field Technician. Drove automated rig to conduct automated survey on residential roads and arterials in Manhattan Beach, followed by inspection of control sections.

Pavement Management Systems

City of Newport Beach, CA

Field Technician. Collecting distress data for AC/PCC surfaces according to the ASTM19/20 system. Conducted windshield inspections on residential, collector and alleyways in Newport Beach.

Distress Data Quality Control

City of West Covina, CA

Field Technician. Collecting distress data for AC/PCC surfaces according to the ASTM19/20 system. Conducted quality control on arterials and collectors in West Covina.

Pavement Management System

City of Santa Barbara, CA

Field Technician. Collecting distress data for AC/PCC surfaces according to the ASTM19/20 system. Inspected residential, collector and urban arterial streets in Santa Barbara.

Pavement Management System

City of Buena Park, CA

Field Technician. Responsible for collecting distress data for AC/PCC surfaces according to the ASTM19/20 system. Inspected urban arterials and residential streets in Buena Park.

Pavement Management Systems

City of Downey, CA

Field Technician. Collecting distress data for AC/PCC surfaces according to the ASTM19/20 system. Inspected residential, collector and urban arterial streets in Downey.

Pavement Management System

City of El Cajon, CA

Field Technician. Responsible for collecting distress data for AC/PCC surfaces according to the ASTM19/20 system. Inspected urban arterials and residential streets in El Cajon.

Pavement Management System

City of King City, CA

Field Technician. Collecting distress data for AC/PCC surfaces according to the MTC8 system. Inspected residential, collector and arterial streets in Pacific Grove.

Pavement Management System

City of Pacific Grove, CA

Field Technician. Responsible for collecting distress data for AC/PCC surfaces according to the MTC8 system. Inspected residential and collector streets in Pacific Grove.

Pavement Management System

City of San Buenaventura, CA

Field Technician. Responsible for collecting distress data for AC/PCC surfaces according to the MTC8 system. Inspected urban collectors and arterials and residential roads in Ventura.

Pavement Management Systems

City of Santa Ana, CA

Field Technician. Collecting distress data for AC/PCC surfaces according to the ASTM19/20 system. Inspected residential and collector streets as part of a full network update for Santa Ana.

Pavement Management Systems

City of South Gate, CA

Field Technician. Collecting distress data for AC/PCC surfaces according to the ASTM19/20 system. Inspected residential, collector and urban arterial streets in South Gate.

Pavement Management Systems

City of Stanton, CA

Field Technician. Collecting distress data for AC/PCC surfaces according to the ASTM19/20 system. Inspected urban arterials in Stanton.

Pavement Management System

City of Torrance, CA

Field Technician. Responsible for collecting distress data for AC/PCC surfaces according to the ASTM19/20 system. Inspected urban arterials in Torrance.

Pavement Management Systems

City of Ventura, CA

Field Technician. Collecting distress data for AC/PCC surfaces according to the ASTM19/20 system. Inspected residential, collector and urban arterial streets in Ventura.

Appendix G-1 Resume of Field Inspectors

Jonathan Moore – Field Technician

Jonathan joined NCE in 2022 as a pavement management technician and since then, has gained in-depth knowledge and expertise in collecting distress data and coring samples for pavement management systems. Apart from conducting field inspections, Jake performs all functions related to data collection and is an active participant in the QC process, including crosschecks of data in the PMS database, quality control checks of field collected data and pavement maintenance history to ensure that PMS databases are accurate and up to date.

Representative Projects

2022-2023 Pavement Management Updates

City of Anaheim, CA

Field Technician. The City has approximately 584 centerline miles and NCE has been assisting the City with updating the PMP since 2013 including transitioning from PAVER™ to StreetSaver®. Jonathan is assisting with performing distress/condition surveys; collecting both ride quality (International Roughness Index) and digital images of the pavements; identifying missing sidewalk gaps; QC; updating the M&R history; creating shapefiles and KML files with the pavement condition information; performing funding and budget scenarios; and providing reports and submittals to OCTA.

2022 PMP Update

City of Lemon Grove, CA

Field Technician. NCE is reviewing all public roadways within the City, evaluating and updating the City's existing Pavement Management Program (PMP), updating existing software used to manage the PMP, provided a capital improvement program (CIP), and CIP budget for the next five years. Jonathan is assisting with updating the City's database with a field survey from a mechanical and/or visual inspection of each pavement section's surface distress information and includes surface and subsurface analysis to quantify the street conditions.

As-Needed Consultant Services for Pavement Management and Road Surveying

County of San Diego, CA

Field Technician. Covering an area of nearly 1,500 square miles, the County maintains approximately 1,950 centerline miles of roadways. The network is comprised of approximately 1,843 centerline miles of asphalt concrete roadways, with the remainder being exposed cement concrete or unpaved disintegrated granite.

Work/Experience Prior to NCE

Los Angeles Department of Water and Power/Osmose Utility Services, Peachtree City, GA

Utility Pole Inspector/Field Technician. Jonathan performed field inspections of utility poles for structural and electrical errors. He logged information into the system and the data was transferred from the IT department to Los Angeles Department of Water and Power, who would send out a crew to mitigate damages and/or potential hazards. During inspections, Jonathan would also utilize measuring equipment and photographed the condition of the poles.

Hampton Tedder Electric Company, Commerce, CA

Quality Control/ Data Entry Technician. Jonathan assisted in transitioning the company's previous paperwork to a digital database. He served as a liaison between different company locations for the Inspectors and foremen from the North and

Metro regions for logging and prepping paperwork. Jonathan worked closely with Inspectors and foremen to ensure work was performed correctly and efficiently.

City of Downey; Downey, CA

Geographic Information Systems Intern. Jonathan maintained an inventory of maps for the Public Works Department that the Engineers used to perform field repairs and other maintenance the City requested. He assisted with the creation of a database of maps that engineers were able to access, alleviating the need to manually research physical maps. Jonathan used GIS on selected projects to create citywide maps for speed limit, traffic volume, and other operations.
