# Appendix G Transportation Assessment

## Appendix

*This page intentionally left blank.*

An aerial photograph of Corona City Park and the surrounding urban area in Corona, California. The park is a large green space with trees and a blue pool, located in the upper center of the image. The surrounding area consists of residential and commercial buildings, streets, and parking lots. The text is overlaid on the top right portion of the image.

# **Chapter 1**

## **Introduction**

This traffic impact study presents the results of a focused traffic analysis of the Corona City Park Revitalization Project (Project). It was prepared to support an Addendum to the previously certified Environmental Impact Report (EIR) for the City of Corona General Plan Technical Update (State Clearinghouse No. 2018081039) (PlaceWorks, December 2019). This analysis was conducted on behalf of the City of Corona (City) in accordance with its *Traffic Impact Study Guidelines* (July 2006) (TIS Guidelines).

### **PROJECT LOCATION**

City Park, located at 930 E. Sixth Street, is generally bounded by Quarry Street to the north, Rimpau Avenue to the east, E. Sixth Street to the south, and E. Grand Boulevard to the west, as shown in Exhibit 1. The northwest and southwest corners of that block are not City property and are not included in the Project Site. The northeast corner contains a City water treatment facility that is also not included in the Project Site. The Project Site is generally comprised of two parcels (Assessor's Parcel Numbers 117-310-001 and 117-301-010) that total approximately 19.6 acres.

### **PROJECT DESCRIPTION**

#### **Existing Land Use and Zoning**

City Park currently provides community recreational amenities including a skate park, basketball/sports courts, playgrounds with equipment, walking paths, covered picnic areas, and an open field/amphitheater. The western strip of the Project Site is currently developed with a YMCA building and public pool. There are five existing surface parking areas totaling 169 spaces with site access provided from driveways on Quarry Street, E. Sixth Street, and E. Grand

---

Boulevard. The Project Site is zoned as Parks & Open Space Recreational Zone in *City of Corona 2020-2040 General Plan* (City of Corona, adopted 2020) (General Plan).

### **Proposed Land Use and Zoning**

The Project does not require a change to the existing zoning. The Project proposes to revitalize the existing City Park through renovation and the construction of new amenities. It follows the preparation of the City's *City Park Master Plan* (July 2023) (Master Plan), which involved a comprehensive assessment of park history, existing conditions, public outreach, and a series of concept designs. The Master Plan recommended a renovation that included a new aquatics center, multiple community buildings totaling 40,000 square feet (sf), new playgrounds and sports courts, a splash pad, botanical gardens, walking paths, and new and improved surface parking areas and vehicular access.

### **Project Description**

The Project Site plan, illustrated in Exhibit 2, builds on the recommendations of the Master Plan. Key features of the Project include:

- An approximately 60,000 sf community center
- A 43,000 sf aquatic center
- A new playground and splash pad
- A new skate park with a pump track
- Basketball and volleyball courts
- An outdoor stage to accompany the existing open field/amphitheater.
- Additional surface parking
- Demolition of the existing YMCA building

In addition, the Project includes relocating all programming and community services currently provided at the existing Circle City Center, an approximately 32,000 sf community center located at 365 N. Main Street (approximately 1.0 miles northwest), to the Project Site. The Circle City

---

Center would then be decommissioned and likely redeveloped with a new use, which is not a part of the Project.

### **Parking and Access**

As shown in Exhibit 2, the Project proposes to incorporate five surface parking lots into the design, along with angled street parking along Quarry Street, totaling approximately 325 spaces. A total of six driveways would provide public access to surface parking from each of the four streets bounding the Project Site. A seventh driveway, located on Quarry Street, would provide service access (including loading and trash) to the community center and aquatic center. The parking areas and driveways are summarized in Tables 1 and 2, respectively.

### **Project Schedule**

Completion of the Project is anticipated in 2029. It would be built in a single phase.

## **STUDY AREA**

A total of 23 intersections and 12 street segment locations were identified for analysis through scoping with City staff. The intersections are listed in Table 3 and the segments are listed in Table 4. All are shown on a map of the Study Area in Exhibit 3. Most of the intersections are controlled by a traffic signal. As noted in Table 3, the remainder are two-way stop-controlled, with the major street traffic uncontrolled and the minor street traffic required to stop.

## **ANALYSIS SCENARIOS**

The following traffic conditions were developed and analyzed as part of this study:

- Existing Conditions (2026): This analysis condition identifies the existing year intersection and segment operating conditions based on traffic counts collected for this report.

- Existing with Project Conditions (2026): This analysis condition estimates the potential intersection and segment operating conditions that could be expected if the Project were built under Existing Conditions.
- Future without Project Conditions (2029): This analysis condition identifies the future buildout year intersection and segment operating conditions before the addition of Project traffic. This analysis adds future background growth assumptions to the Existing Conditions.
- Future with Project Conditions (Year 2029): This analysis condition estimates the potential intersection and segment operating conditions that could be expected if the Project were operational at the projected buildout year. In this analysis, the Project-generated traffic is added to Future Conditions (Year 2029).

## **SUMMARY OF RESULTS AND RECOMMENDATIONS**

Intersections were analyzed for level of service (LOS) in accordance with the methodologies described in Chapter 2. Signalized and unsignalized intersection LOS was determined using the definitions shown in Table 5 to convert vehicle delay to LOS. As shown, LOS categories range from excellent, nearly free-flow traffic at LOS A to stop-and-go conditions at LOS F.

Table 6 provides a summary of the intersection LOS results for all three analyzed peak hours (weekday morning peak hour, weekday afternoon peak hour, Saturday midday peak hour) for each of the four analyzed scenarios. As shown, in all scenarios, 22 of the 23 study intersections operate at LOS D or better during each peak hour. One intersection would operate at LOS E during the weekday afternoon and Saturday midday peak hours under all four analyzed scenarios. However, the Project would reduce average vehicle delay at that intersection and, therefore, it would not result in a deficiency.

Road segment volumes were compared against daily segment capacities as described in Chapter 2. All 12 study segments would operate below daily capacity in all scenarios, and no deficiency would occur.

One unsignalized intersection would meet the peak hour signal warrant during the weekday afternoon peak hour. However, based on further review, as detailed in Chapter 6, it is not recommended for signalization.

---

Neither analyzed freeway ramp location would experience vehicle queues on the off-ramps reaching back to the freeway mainline. Therefore, no deficiencies would occur.

The Project assumes right-turn in/out access only at certain driveways: Intersections #6 E. Grand Boulevard & Kress Court, #8 Kress Court & E. Sixth Street, and #12 Park Driveway (east) & E. Sixth Street. The installation of “porkchop” island treatments and appropriate signage are recommended at these locations (within the public right-of-way) to reinforce the right-turn restrictions.

City staff have indicated that transit service changes are being planned, with re-routing to expand service on E. Sixth Street between Rimpau Avenue and E. Grand Boulevard. The installation of transit vehicle turnout(s) along the Project’s E. Sixth Street frontage (within the public right-of-way and to the City’s standard design) is recommended to accommodate the future transit service expansion.

## **ORGANIZATION OF REPORT**

This report is divided into seven chapters, including this introduction. Chapter 2 describes the methodologies used to analyze the various intersections and roadways in the Study Area. Chapter 3 describes the existing conditions, including the existing roadway network, traffic volumes, and existing LOS at study intersections and roadway segments. Chapter 4 describes the future conditions, including Project traffic, background traffic, and future with Project traffic. Chapter 5 presents the traffic analysis under the four analyzed scenarios. Chapter 6 includes the determination of any deficiencies and recommended improvements. Chapter 7 presents an analysis of site access and circulation. The appendices contain supporting documentation and additional details supporting the technical analyses.

**TABLE 5**  
**INTERSECTION LEVEL OF SERVICE DEFINITIONS**

| Level of Service | Description                                                                                                                                                                                               | Delay                    |                            |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|----------------------------|
|                  |                                                                                                                                                                                                           | Signalized Intersections | Unsignalized Intersections |
| A                | EXCELLENT. No vehicle waits longer than one red light and no approach phase is fully used.                                                                                                                | $\leq 10$                | $\leq 10$                  |
| B                | VERY GOOD. An occasional approach phase is fully utilized; many drivers begin to feel somewhat restricted within groups of vehicles.                                                                      | $> 10$ and $\leq 20$     | $> 10$ and $\leq 15$       |
| C                | GOOD. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.                                                                                 | $> 20$ and $\leq 35$     | $> 15$ and $\leq 25$       |
| D                | FAIR. Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.                            | $> 35$ and $\leq 55$     | $> 25$ and $\leq 35$       |
| E                | POOR. Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.                                                          | $> 55$ and $\leq 80$     | $> 35$ and $\leq 50$       |
| F                | FAILURE. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Tremendous delays with continuously increasing queue lengths. | $> 80$                   | $> 50$                     |

Notes:

**Notes:**

See Tables 10A and 11A.

---

## **Chapter 2**

### **Methodologies**

This chapter summarizes the methodologies used to analyze intersections and road segments in this study.

#### **INTERSECTION OPERATING CONDITIONS**

The 23 study intersections identified in Table 3 and shown in Exhibit 3 were analyzed for the weekday morning and afternoon peak hours and the Saturday midday peak hour. They were analyzed for LOS using methodologies detailed in *Highway Capacity Manual, 7<sup>th</sup> Edition* (Transportation Research Board, 2022) (HCM). The HCM methodology was implemented using Synchro 12 software.

The intersection analyses incorporated a traffic volume adjustment called Peak Hour Factor (PHF), which represents the proportion of the peak hour volume made up of the busiest 15-minute period of traffic within that hour. PHF is expressed as a percentage where a value of 1.0 (i.e., 100%) indicates a perfectly even traffic flow across the four 15-minute periods of the peak hour. A PHF that approaches 1.0 suggests a stable flow of traffic volume through an intersection, while a lower PHF suggests a more variable flow of traffic. Application of the PHF yields a more conservative analysis as it simulates a condition in which the highest 15-minute traffic volume were to repeat during the peak hour. Synchro assumes a systemwide default PHF of 0.92. Review of the intersection counts indicated that the systemwide PHF ranged from 0.923 to 0.944 during the respective analyzed periods; the PHF as calculated from the intersection count data is higher (less conservative) than the default 0.92 PHF assumed in Synchro. For the purposes of this analysis, the systemwide 0.92 PHF was applied.

---

### **Signalized Intersection LOS**

Signalized intersections were analyzed using the HCM signalized methodology. The HCM signalized methodology calculates the average delay, in seconds, for each vehicle passing through the intersection. Signal timing information was obtained from the City and California Department of Transportation (Caltrans) for each signalized location.

Signalized intersection LOS was determined using the definitions shown in Table 5 to convert average vehicle delay to LOS. As shown, LOS categories range from excellent, nearly free-flow traffic at LOS A to stop-and-go conditions at LOS F.

### **Unsignalized Intersection LOS**

Each of the nine unsignalized study intersections is two-way stop-controlled. The HCM unsignalized two-way stop-control methodology calculates the control delay, in seconds, for individual movements through an intersection and reports the highest delay of any movement. In most cases, the worst-case delay is experienced by vehicles turning left from the minor street to the major street. It is important to note that the majority of traffic through a two-way stop-controlled intersection is typically on the major street and experiences no delay passing through the intersection.

As with signalized intersections, unsignalized intersection LOS was determined using the definitions shown in Table 5 to convert worst-case vehicle delay to LOS.

### **Intersection Standards of Operation**

Goal CE-1.5 of the General Plan Circulation Element identifies LOS D as the minimum acceptable operating condition for intersections in the City. However, Intersections #14 and #15, N. Main Street & SR 91 westbound and eastbound ramps, respectively, are identified in the Circulation Element as having an LOS exemption and may operate at LOS E. According to the Circulation Element, other intersections may also be considered approved for an LOS exemption at the City's discretion.

---

## **Intersection Deficiency Thresholds**

Section 6 of the TIS Guidelines summarizes conditions under which a project's effect on intersection operations would be considered an impact (i.e., a deficiency). There are two key criteria applicable to the analysis in this report:

1. A project would cause a deficiency if it causes an intersection projected to operate at LOS D or better under Future without Project Conditions to operate at LOS E or F under Future with Project Conditions.
2. A project would cause a deficiency if it causes an impact to an intersection already operating at LOS E or F under Future without Project Conditions.

Should a deficiency be identified, feasible measures to mitigate the impact should be identified.

## **STREET SEGMENT CAPACITIES**

The 12 street segments were analyzed using a segment capacity evaluation based on the daily capacity of the designated roadway classification. The daily capacities were identified based on the City's Street Design Table (Standard Plan No. 100, 2016) and *General Plan 2020-2040 Technical Background Report* (Adopted November 2021). The applicable daily roadway capacities include the Major Arterial/Mixed-Use Boulevard and Collector classifications for four lane roadways at LOS D operation, which the Circulation Element identifies as the minimum acceptable LOS for roadway segments.

Segment F, E. Sixth Street west of E. Grand Boulevard, is identified in the Circulation Element as having an LOS exemption and may operate at LOS E. For the purposes of this analysis, the LOS D maximum daily capacity for two-lane (16,700 vehicles per day) and four-lane (32,300 vehicles per day) Major Arterials and Collector streets (11,700 vehicles per day) were utilized for all analyzed roadway segments, including Segment F.

Should any street segment be forecast to have daily traffic volumes exceeding the identified capacity, further evaluation must be conducted for potential peak hour capacity deficiencies.

---

## TRAFFIC SIGNAL WARRANTS

Key unsignalized intersections were analyzed against signal warrants to determine the need for a traffic signal. Signal warrants are sets of technical criteria to justify installation of a traffic signal and can be based on vehicular traffic volumes, pedestrian activity, safety, or various other criteria. Warrant guidelines are set forth in *California Manual on Uniform Traffic Control Devices 2026* (Caltrans, 2026). This report used thresholds from Warrant #3, Peak Hour, which examines operating conditions during the analyzed peak hours. One set of criteria under Warrant #3 is based on the cumulative total minor street delay experienced by all of the vehicles turning from the minor street to the major street. The other set of criteria compares the relative demand of major street and minor street traffic during the peak hour.

## FREEWAY OFF-RAMP QUEUES

In addition to the intersection LOS analysis described above, Caltrans requires that freeway off-ramps be analyzed for the potential for vehicle queues to back up to the mainline lanes, where stopped vehicles could pose a safety hazard to moving traffic on through lanes. The Synchro analysis used to conduct the LOS analysis also estimates the 95<sup>th</sup> percentile queue in number of stopped vehicle per lane. The number of vehicles is converted into length by assuming 25 feet per vehicle (including both the length of the vehicle and the amount of space drivers typically leave between stopped vehicles) and compared to the length of the off-ramps. The 95<sup>th</sup> percentile queue is a condition that is expected to rarely, if ever, occur in reality and, therefore, this methodology represents a conservative assessment of the potential for queuing that could pose a safety concern for mainline freeway traffic.

---

## **Chapter 3**

### ***Existing Conditions***

This chapter summarizes the existing roadway network and other transportation features of the Study Area. It also includes analysis of the Existing Conditions traffic volumes at the study intersections and street segments.

#### **EXISTING ROADWAY NETWORK**

The existing street system in the Study Area a variety of regional, sub-regional, or local roadway types. Street classifications are designated in the Circulation Element, which defines specific street standards to provide an enhanced balance between traffic flow and other important street functions including transit routes and stops, pedestrian environments, bicycle routes, building design and site access, etc. Per the Circulation Element, street classifications are defined as follows:

- Major Arterials have the highest traffic-carrying capacity, with the highest speed and limited interference with traffic flow from driveways or abutting properties. Major Arterials may be four or six lanes, depending on traffic volumes, and may have center medians. Parking may or may not be allowed.
- Secondary Arterials connect traffic from collector streets to streets of higher classification with limited access to abutting properties. Secondary Arterials carry some through traffic and may or may not provide on-street parking or Class 2 bike lanes. Secondary arterials are typically four lanes wide.
- Collectors are intermediate routes in a road network. Collectors may handle some localized “through” traffic from one local street to another; but their purpose is to connect local streets to the arterial network. Collectors are typically two lanes wide.
- Mixed-Use Boulevards are streets that serve land use patterns in the City’s mixed-use land use districts.
- Special Residential Arterials are a type of street intended to accommodate land use patterns on E. Grand Boulevard and W. Grand Boulevard (the Circle) and surrounding

---

environment. These streets will include improvements sensitive to adjacent residential uses.

### **Key Roadways in Study Area**

- **Main Street** – Main Street is a designated Major Arterial. It travels in the north-south direction and is located approximately 0.5 miles west of the western boundary of the Project Site. It provides four travel lanes south of Sixth Street and six travel lanes north of Sixth Street (where it provides ramps to and from SR 91), with left-turn lanes at intersections and a raised median. On-street parking is generally prohibited within the Study Area.
- **Grand Boulevard (the Circle)** – Grand Boulevard is a designated Major Arterial. It travels in a continuous circle with a diameter of approximately 0.9 miles. It is named W. Grand Boulevard on the western portion of the Circle and E. Grand Boulevard on the eastern portion, with Main Street as the dividing point. The western boundary of the Project Site is E. Grand Boulevard. It generally provides five lanes, including two in each direction and a two-way left-turn median. On-street parking is generally prohibited within the Study Area.
- **E. Sixth Street** – E. Sixth Street is a designated Mixed-Use Boulevard. It travels in the east-west direction and forms the southern boundary of the Project Site. It provides five lanes, including two in each direction and a two-way left-turn median. On-street parking is not available, but it provides Class II on-street bicycle lanes adjacent to the Project Site and, west of E. Grand Boulevard (within the Circle), it provides Class III shared lane markings for bicyclists.
- **Quarry Street** – Quarry Street is a designated Collector. It travels in the east-west direction between E. Grand Boulevard and the Temescal Wash<sup>1</sup> and forms the northern boundary of the Project Site. It provides one lane in each direction, and on-street parking is generally available on both sides of the street.
- **Rimpau Avenue** – Rimpau Avenue is a designated Collector north of Sixth Street and a Secondary Arterial south of Sixth Street. It generally travels in the north-south direction and is the eastern boundary of the Project Site. It provides one travel lane in each direction. South of Sixth Street, it also provides a two-way left-turn median and a combination of Class II bicycle lanes and Class III shared lane markings. On-street parking is available on the west side of the street, north of E. Sixth Street, and on the east side of the street, south of E. Sixth Street.
- **Fullerton Avenue** – Fullerton Avenue is a designated Special Residential Arterial. It generally travels in the northwest-southeast direction and is located southwest of the Project Site. It provides one travel lane in each direction, with a two-way left-turn median and Class III shared lane markings for bicyclists.
- **Magnolia Avenue** – Magnolia Avenue is a designated Major Arterial. It generally travels in the northeast-southwest direction south of the Project Site. It generally provides two

---

<sup>1</sup> Quarry Street ends in a cul-de-sac approximately 420 feet east of the Project Site.

---

travel lanes in the southwest direction and three lanes in the northeast direction, with a raised median. On-street parking is generally allowed in the southwest direction only.

## **Freeways**

Freeways are high-volume, high-speed roadways with limited access provided by interchanges that carry regional traffic through and do not provide local access to adjacent land uses. They are operated by Caltrans. Freeways in the Project vicinity include:

- **SR 91** – SR 91 runs in the east-west direction and is located approximately 0.5 miles north of the Project Site. It provides seven to eight travel lanes in each direction (including lanes leading to and from the I-15 interchange, which is located approximately 0.5 miles northeast of the Project Site). Within the Study Area, access to and from SR 91 is available via the Main Street ramps, approximately 0.6 miles northwest of the Project Site.
- **I-15** – I-15 generally runs in the north-south direction and is located approximately 0.5 miles east of the Project Site. It provides seven travel lanes in each direction (including lanes leading to and from the SR 91 interchange). Within the Study Area, direct access to and from I-15 is available via the Magnolia Avenue ramps, approximately 1.0 miles southeast of the Project Site. Alternatively, I-15 may be accessed via the SR 91 ramps at Main Street and the SR 91 / I-15 interchange.

The existing traffic control and geometrics of the analyzed intersections are illustrated in Exhibit 4.

## **ALTERNATIVE TRANSPORTATION NETWORKS**

The alternative transportation (transit, bicycle, and pedestrian) networks in the City provide non-automotive means of travel within the Study Area.

Transit service with stops adjacent to the Project Site includes the Corona Cruiser Red Line along E. Grand Boulevard and Riverside Transit Authority (RTA) Bus Route 1 along E. Sixth Street. Additional transit service in the vicinity includes the Corona Cruiser Blue Line, RTA Route 206, and Metrolink trains accessed at the North Main Metrolink Station approximately 0.75 miles northwest of the Project Site. The transit service in the vicinity of the Project Site is illustrated in Exhibit 5A.

Bicycle facilities adjacent to the Project Site include Class II bike lanes (i.e., striped curbside bicycle lanes) along E. Sixth Street east of E. Grand Boulevard, Class III bike lanes (i.e., “sharrows,” or

---

shared lane markings indicating bicycles may share a lane with vehicles) along E. Sixth Street west of E. Grand Boulevard, and a Class III bike route along E. Grand Boulevard north of E. Sixth Street. Pedestrian facilities include sidewalks along all frontages with marked crossings adjacent to the Project Site at Intersections #7, E. Grand Boulevard & E. Sixth Street, and #9, Rimpau Avenue & E. Sixth Street. The bicycle and pedestrian facilities in the vicinity of the Project Site are illustrated in Exhibit 5B.

## **EXISTING TRAFFIC CONDITIONS**

New traffic counts were collected at the analyzed intersections and street segment locations in February 2026. The counts were collected on a weekday and Saturday on days with clear weather during a non-holiday week. Intersection turning movement counts were collected during typical weekday morning (6:30 AM to 9:00 AM) and afternoon (4:00 PM to 6:00 PM) peak periods and on Saturday during the midday peak period (12:00 PM to 2:00 PM). Street segment counts were collected over a 24-hour period on the same weekday and Saturday as the intersection counts. The traffic count sheets are provided in Appendix A.

The peak hour was the busiest consecutive 60-minute period of each counted peak period at each intersection. The existing weekday peak hour intersection counts are illustrated in Exhibit 6A and Saturday peak hour intersection counts in Exhibit 6B; the existing weekday and Saturday street segment volumes are provided in Exhibit 7.

### **Intersection LOS**

Table 7A summarizes the weekday morning and afternoon and Saturday midday peak hour LOS results for the study intersections under Existing Conditions. As shown, 22 out of the 23 study intersections operate at LOS D or better during all three peak hours. Intersection #20, Rimpau Avenue & Magnolia Avenue, operates at LOS E during the weekday afternoon and Saturday midday peak hours. Detailed LOS worksheets are provided in Appendix B.

### **Street Segment Capacity Evaluation**

Table 7B summarizes the weekday and Saturday street segment analysis. As shown, all 12 segments have daily traffic volumes below the facility capacities on weekdays and Saturdays.

Notes:

2WLT = two-way left-turn median. LOS = level of service. vpd = vehicles per day (two directions).

[a] Estimated capacity per City of Corona, Standard Plan 100 - Street Design Table & *General Plan 2020-2040 Technical Background Report* for the respective street classification. Target LOS is from Goal CE-1.5 in the Circulation Element.

[b] A LOS E/F operational exemption was identified in the Circulation Element for E. Sixth Street within the Circle.

---

## **Chapter 4**

### **Future Conditions**

This chapter describes the development of Future traffic estimates.

#### **PROJECT TRAFFIC**

##### **Trip Generation**

The two primary components of the Project Site that generate off-site trips are the community center and the aquatic center. Project trip generation – including weekday daily, weekday morning and afternoon peak hour, Saturday daily, and Saturday midday peak hour – for these two uses was estimated using various sources. For the community center and the Circle City Center relocation, trip generation was estimated using rates published in *Trip Generation Manual, 12<sup>th</sup> Edition* (Institute of Transportation Engineers [ITE], 2025) (Trip Generation Manual). Trip generation associated with the aquatic center was based on data obtained from other municipal aquatic centers in nearby cities. Each is described in detail below.

In consultation with City staff, a trip reduction of 10% was applied to reflect potential non-automobile travel (e.g., bicycling or walking) to and from the Project Site and Circle City Center.

**Community Center.** The Community Recreation Center rates (ITE Land Use Code 495) were utilized to estimate trip generation for the community center at City Park and the Circle City Center relocation. Consistent with the proposed uses at the Project Site, this land use is described in the Trip Generation Manual as “a stand-alone public facility similar to and including YMCAs. These facilities often include...meeting rooms and other social facilities, ...exercise classes, weightlifting and gymnastics equipment...” These trip rates are shown in Table 8.

---

**Aquatic Center.** The Trip Generation Manual does not provide rates specific to an aquatic center. Therefore, a trip generation study was prepared to develop the appropriate trip generation rates. Data was obtained from four comparable municipal aquatic facilities located in Southern California and selected by City staff. Each of the following operational characteristics were collected for these facilities with assistance from the respective staff:

- Facility size
- Operating hours
- Staffing levels
- Peak season (i.e., summer, when schools are out of session) programming schedule
- Program capacities
- Attendance data
- Seasonality
- Facility operating limits
- Other general facility observations

Trip generation rates were developed from the operational characteristics for each facility on a per person basis of the daily programming capacity. The four facilities' rates were averaged to develop peak season trip generation rates to apply to the Project. Additionally, based on the seasonality and attendance data, off-peak season (i.e., during the school year) rates were estimated to be 20% lower than peak season rates. Based on discussion with City staff, the off-peak season was determined to better represent typical conditions for the purpose of this traffic analysis. The off-peak season rates are shown in Table 8. The full development of the aquatic center trip generation rates, including peak season and off-peak season rates, is provided in Appendix C.

**Project Trip Generation Summary.** Table 8 details the calculation of the Project's trip generation estimates. As shown, the community center and aquatic center (during the off-peak season) combined would generate approximately 2,261 trips on a weekday, including 152 during the morning peak hour and 251 during the afternoon peak hour. They would generate approximately 1,544 daily trips on a Saturday, including 157 during the midday peak hour. These estimates represent the total number of trips to and from the Project Site.

---

As described in Chapter 1, all programming and services offered at the Circle City Center will be permanently relocated to City Park. As shown in Table 8, Circle City Center is estimated to generate approximately 830 trips on a weekday (including 59 morning peak hour trips and 83 afternoon peak hour trips) and 444 trips on a Saturday (including 32 midday peak hour trips). These trips are considered to be inherent in the Project Site trip generation estimates described above and would no longer travel to and from the Circle City Center. As this is all an effect of the Project, the Project is considered to have a net trip generation of 1,431 trips on a weekday (including 94 during the morning peak hour and 168 during the afternoon peak hour) and 1,100 trips on a Saturday (including 124 during the midday peak hour).

### **Trip Distribution**

TIS Guidelines Section 4.4 requires that projects generating over 200 gross peak hour trips use the City's Traffic Forecast Model (City Model) to determine the geographic distribution pattern of project trips. However, the City Model was determined by City staff not to be suitable for use with the Project.<sup>2</sup> Instead, the City's "big data" subscription service (Placer.ai) was identified as an acceptable substitute. This service aggregates millions of electronic geo-location records from cell phones and connected vehicles and combines it with a predictive algorithms to estimate distribution patterns in the form of origin/destination zip code data.

In this case, City staff obtained annualized visitor origin data for seven different City parks. These were reviewed to determine local vs. regional distribution, general directional distribution patterns for each park, and remove outliers (i.e., originations from distant zip codes). The commonalities in these patterns were translated to the Project Site to develop Project trip distribution patterns, as recommended by City staff. In general, the Project distribution was estimated to be 25% each to the north and west and 20% each to the south and east outside of the Study Area, with 10% within the Study Area.

The local distribution was further refined based on the characteristics of the street system serving the Project Site, the locations of residential and commercial centers from which visitors might be

---

<sup>2</sup> The public park use is an atypical use in the Traffic Forecast Model and was not anticipated to provide sufficient data from a select zone analysis to inform the trip distribution development.

---

drawn, existing traffic volumes and operating conditions, and the locations of Project Site driveways and parking areas. The overall Project Site trip distribution pattern is illustrated in Exhibit 8.

The same process was also applied to the Circle City Center site to evaluate the elimination of existing trips from that location. The trip distribution pattern for Circle City Center is provided in Exhibit 9.

### **Trip Assignment**

The Project trip generation estimates detailed in Table 8 were distributed according to the patterns for the Project Site and the Circle City Center shown in Exhibits 8 and 9, respectively. Exhibit 10A illustrates the Project-only traffic volumes at the study intersections during typical weekday morning and afternoon peak hours and Exhibit 10B illustrates the volumes during the Saturday mid-day peak hour. Exhibit 7 illustrates the weekday and Saturday segment volumes. In each Exhibit, the Project-only volumes include both the gross Project Site trip generation using the Project Site distribution pattern and the removal of Circle City Center trips using the Circle City Center distribution pattern.

### **EXISTING WITH PROJECT**

The Existing with Project Conditions traffic volumes were developed by combining the Existing Conditions traffic volumes illustrated in Exhibits 6A and 6B and the Project-only traffic volumes in Exhibits 10A and 10B. The resulting Existing with Project conditions for weekday and Saturday are illustrated in Exhibits 11A and 11B, respectively. The weekday and Saturday street segment volumes are illustrated in Exhibit 7.

### **FUTURE TRAFFIC GROWTH**

For the analysis of Future Conditions, existing traffic volumes are expected to increase both due to known planned developments in the Study Area (Cumulative Projects) as well as general regional growth and development beyond the boundaries of the Study Area (ambient growth).

---

## **Cumulative Projects**

The City Planning Department provided a list of current development projects in the City as of February 2026. Though the buildout years of many of these Cumulative Projects are uncertain and may be well beyond the buildout year of the Project and, notwithstanding that some may never be approved or developed, all that met the screening criteria below were assumed to be completed by the Project buildout year 2029. Therefore, the traffic growth due to the development of Cumulative Projects considered in this analysis is highly conservative and, by itself, substantially overestimates the actual traffic volume growth in the area that would likely occur in the next three years prior to Project buildout.

The list was screened for projects generally within a 1.0-mile radius of the Project Site. All commercial projects greater than 10,000 sf and residential projects greater than 15 dwelling units were included in the development of Future Conditions. Projects below those thresholds were presumed to be captured within the ambient growth factor described below. The projects meeting the selection criteria are detailed in Table 9 with their locations illustrated in Exhibit 12.

The development of estimated traffic volumes added to the study intersections due to Related Projects involves the use of the same three-step process of trip generation, trip distribution, and trip assignment used for the Project. Trip generation estimates for the Cumulative Projects, shown in Table 9, were calculated using the descriptions and applying the appropriate trip generation rates from the Trip Generation Manual. The geographic distribution of Cumulative Projects traffic was developed based on the type and density of the proposed land uses, the geographic distribution of the population from which the employees/residents and potential patrons of the proposed developments are drawn, and the location of these projects in relation to the surrounding street system. Exhibits 13A and 13B illustrate the peak hour traffic volumes associated with these Cumulative Projects at the study locations on a weekday and Saturday, respectively. Exhibit 7 illustrates the Cumulative Project weekday and Saturday segment volumes.

---

## **Ambient Growth**

Existing traffic is also expected to increase because of regional growth and development not yet proposed or located outside the Study Area. Based on the TIS Guidelines, an ambient growth factor of 2% per year compounded annually was applied to the existing traffic volumes to reflect the effects of the regional growth and development. The total adjustment applied over the three-year period between year 2026 and year 2029 (the anticipated buildout year of the Project) was 6.12%. When considered along with the Cumulative Projects, the traffic growth assumption is even more conservative.

## **FUTURE CONDITIONS TRAFFIC VOLUMES (YEAR 2029)**

### **Future without Project Conditions Traffic Volumes**

The Future without Project Conditions traffic volumes are, therefore, the sum of the Existing Conditions traffic volumes, 6.12% ambient growth, and the Cumulative Projects traffic volumes from Exhibits 13A and 13B. The weekday and Saturday peak hour traffic volumes are illustrated in Exhibits 14A and 14B, respectively. The weekday and Saturday segment volumes are illustrated in Exhibit 7.

### **Future with Project Traffic Volumes**

The Future with Project Conditions traffic volumes add the Project Only traffic volumes from Exhibits 10A and 10B to the Future without Project Conditions traffic volumes from Exhibits 14A and 14B. The weekday and Saturday peak hour traffic volumes are illustrated in Exhibits 15A and 15B, respectively. The weekday and Saturday segment volumes are illustrated in Exhibit 7.

## **FUTURE ROADWAY IMPROVEMENTS**

The Streetscape Enhancements component of the City's *Downtown Revitalization Plan* (2022) identified the addition of a landscaped center median to the E. Sixth Street corridor. This will result

in the construction of a continuous raised center median along the Project's E. Sixth Street frontage, generally between Rimpau Avenue and E. Grand Boulevard. The Project's two E. Sixth Street driveways (Intersections #8, Kress Court & E. Sixth Street, and #12, Park Driveway (east) & E. Sixth Street) will be restricted to operate as right-turn in/right-turn out access only, as noted in Chapter 1.

**Notes:**

- [a] Community Center trip generation rates used "Community Recreation Center" (Land Use Code 495) data from *Trip Generation Manual, 12th Edition*, Institute of Transportation Engineers, 2025.
- [b] Aquatic Center trip generation rates developed for the Project based on programming data from comparable facilities in Southern California. Rates shown represent off-peak (i.e., school-year) activity levels. See Appendix C for details as well as rates for peak season..
- [c] Based on program capacity, which was provided by City staff based on estimated total daily participants for a preliminary aquatics schedule and open swim.
- [d] As part of the Project, all existing CCC programming will relocate to the Project Site upon completion. Those activities are assumed to be captured in the trip generation estimates for the Project Site above. The trips currently generated at the CCC (located at 362 N. Main Street) would be removed from the street network as part of the Project.

## **Chapter 5**

### ***Traffic Analysis***

This chapter presents the intersection LOS and street segment analyses for each of the four analyzed scenarios.

#### **ANALYSIS METHODOLOGY**

As described in Chapter 2, intersections were analyzed using the HCM methodology to calculate delay and LOS in accordance with the definitions in Table 5. Street segments were evaluated against maximum daily volumes established in the TIS Guidelines for roads of different classifications and lane totals.

#### **EXISTING WITH PROJECT CONDITIONS (YEAR 2026)**

##### **Intersection LOS**

Table 10A summarizes the weekday and Saturday peak hour intersection LOS for Existing Conditions and Existing with Project Conditions. As shown, 22 of the analyzed intersections are projected to operate at LOS D or better during each of the analyzed peak hours under Existing Conditions. Intersection #20, Rimpau Avenue & Magnolia Avenue, currently operates at LOS E during the weekday afternoon and Saturday midday peak hours.

As shown in Table 10A, Intersection #20, Rimpau Avenue & Magnolia Avenue, is projected to continue to operate at LOS E under the Existing with Project Conditions during those two peak hours, and the Project would result in a reduction in average vehicle delay at that intersection. Additionally, Intersections #21, Fullerton Avenue & Magnolia Avenue, and #22, Kellogg Avenue & Magnolia Avenue, are also projected to operate with a reduction in average vehicle delay under

---

Existing with Project Conditions. No intersection would worsen from LOS D or better to LOS E or F conditions with the addition of Project traffic.

In situations where trips are added to a lower-than-average-delayed movement through an intersection (typically, through movements experience less delay than left-turn movements, for example), the result is often a decrease in average delay for the intersection as a whole, which generally indicates available through movement capacity. The Project's right-turn restrictions and/or the addition of Project trips would also result in a reduction in average vehicle delay at Intersections #6, E. Grand Boulevard & Kress Court, and #8, Kress Court & E. Sixth Street, during one or more peak hours. Detailed LOS worksheets are provided in Appendix B.

### **Street Segment Capacity Evaluation**

Table 10B summarizes the weekday and Saturday street segment evaluation results for Existing Conditions and Existing with Project Conditions. As shown, the daily volume at each segment does not exceed the identified operational capacity of the respective street classification under either condition. Therefore, each street segment meets the respective operational target under both Existing Conditions and Existing with Project Conditions.

## **FUTURE CONDITIONS (YEAR 2029)**

### **Intersection LOS**

Table 11A summarizes the weekday and Saturday peak hour intersection LOS for Future without Project Conditions and Future with Project Conditions. As shown, 22 of the analyzed intersections are projected to operate at LOS D or better during each of the analyzed peak hours under Future without Project Conditions. Intersection #20, Rimpau Avenue & Magnolia Avenue, is forecast to operate at LOS E during the weekday afternoon and Saturday midday peak hours.

As shown in Table 11A, Intersection #20, Rimpau Avenue & Magnolia Avenue, is projected to continue to operate at LOS E under the Future with Project Conditions during those two peak hours, and the Project would result in a reduction in average vehicle delay at that intersection.

---

Additionally, Intersections #21, Fullerton Avenue & Magnolia Avenue, and #22, Kellogg Avenue & Magnolia Avenue, are also projected to operate with a reduction in average vehicle delay under the Existing with Project Conditions. No intersection would worsen from LOS D or better to LOS E or F conditions with the addition of Project traffic.

As noted above, in situations where trips are added to a lower-than-average-delayed movement through an intersection (typically, through movements experience less delay than left-turn movements, for example), the result is often a decrease in average delay for the intersection as a whole, which generally indicates available through movement capacity. The Project's right-turn restrictions and/or the addition of Project trips would also result in a reduction in average vehicle delay at Intersections #6, E. Grand Boulevard & Kress Court, and #8, Kress Court & E. Sixth Street, during one or more peak hours. Detailed LOS worksheets are provided in Appendix B.

### **Street Segment Capacity Evaluation**

Table 11B summarizes the weekday and Saturday street segment evaluation results for Future without Project Conditions and Future with Project Conditions. As shown, the daily volume at each segment does not exceed the identified operational capacity of the respective street classification under either condition. Therefore, each street segment meets the respective operational target under both Future without Project Conditions and Future with Project Conditions.

### **SIGNAL WARRANT ANALYSIS**

Peak hour signal warrant analyses were conducted for key unsignalized study intersections, including:

- Intersection #2, E. Grand Boulevard & Quarry Street
- Intersection #4, Arroya Avenue & Quarry Street
- Intersection #5, Rimpau Avenue & Quarry Street
- Intersection #11, Rimpau Avenue & E. Fifth Street

---

The remaining unsignalized study intersections are Project Site driveways. As the minor street peak hour traffic volumes at the driveways are much lower than any of the warrant thresholds, warrant analysis was deemed unnecessary for these locations.

The signal warrant analysis results are summarized in Table 12 and detailed warrant worksheets are provided in Appendix D. As shown, under both Future without Project Conditions and Future with Project Conditions, three of the four intersections do not meet the signal warrant during any peak hour. Intersection #2, E. Grand Boulevard & Quarry Street, is forecast to meet the warrant during the afternoon peak hour under both Future without Project Conditions and Future with Project Conditions.

### **FREEWAY OFF-RAMP QUEUEING**

Two study intersections are Caltrans freeway off-ramp locations – Intersections #14 and #15, S. Main Street & SR 91 westbound and eastbound ramps, respectively. Both off-ramps provide four lanes (between left-turn lanes, right-turn lanes, and shared lanes) at the respective intersections, with the off-ramps themselves providing two lanes diverging from the freeway mainline.

The 95<sup>th</sup> percentile off-ramp queues, as calculated by Synchro along with the intersection LOS results (provided in Appendix B), are shown in Table 13 for Future without Project Conditions and Future with Project Conditions<sup>4</sup>. As shown, both off-ramps are estimated to experience shorter queues than the available turn pocket and off-ramp storage. Further, the Project would add no more than approximately 15 feet to the queue at either off-ramp during the peak hours. Therefore, the queues would not interfere with freeway mainline operations and would not result in a safety impact at either off-ramp.

---

<sup>4</sup> This analysis is also available for Existing with Project Conditions in the Synchro worksheets provided in Appendix B.

**Notes:**

2WLT = two-way left-turn median. LOS = level of service. vpd = vehicles per day (two directions).

[a] Estimated capacity per City of Corona, Standard Plan 100 - Street Design Table & *General Plan 2020-2040 Technical Background Report* for the respective street classification. Target LOS is from Goal CE-1.5 in the Circulation Element.

[b] A LOS E/F operational exemption was identified in the Circulation Element for E 6th Street within the Circle.

**Notes:**

2WLT = two-way left-turn median. LOS = level of service. vpd = vehicles per day (two directions).

[a] Estimated capacity per City of Corona, Standard Plan 100 - Street Design Table & *General Plan 2020-2040 Technical Background Report* for the respective street classification. Target LOS is from Goal CE-1.5 in the Circulation Element.

[b] A LOS E/F operational exemption was identified in the Circulation Element for E 6th Street within the Circle.

Notes:

Warrant analysis based on Warrant #3, Peak Hour, from *California Manual on Uniform Traffic Control Devices 2026* (Caltrans, 2026).

Part A evaluates the total cumulative delay experienced by vehicles turning from the minor street to the major street. Part B compares the minor street traffic volume to the major street traffic volume. Signal warrant worksheets are provided in Appendix D.

## **Chapter 6**

### ***Project Deficiencies and Improvements***

This chapter summarizes the analysis results presented in Chapter 5 related to Project-related deficiencies in traffic conditions.

#### **INTERSECTIONS**

All but one intersection would operate at LOS D or better during all analyzed scenarios. Intersection #20, Rimpau Avenue & Magnolia Avenue, would operate at LOS E during the weekday afternoon and Saturday midday peak hours; however, the addition of Project traffic would result in a decrease in average delay at that location during those peak hours and, therefore, there would be no Project-related deficiency and no improvements would be required.

Although the Project is projected to add traffic to an already operationally deficient location, the intersection is physically constrained in a fully built-out location. It should be noted that the City is currently studying traffic improvements at this location for implementation under another effort. In addition, a Citywide traffic signal optimization project is actively underway and is projected to improve corridor travel times (including on the Magnolia Avenue corridor).

#### **STREET SEGMENTS**

All of the street segments would be below their operating capacities during all analyzed scenarios, without and with the Project traffic and, therefore, no improvements would be required.

---

## **SIGNAL WARRANTS**

One unsignalized intersection – Intersection #2, E. Grand Boulevard & Quarry Street – would meet the peak hour traffic signal warrant based on conditions during the weekday afternoon peak period. The signal warrant would be met both under Future without Project Conditions and Future with Project Conditions.

It should be noted that the determination that an unsignalized intersection meets the traffic signal warrant does not in itself require the installation of a signal. Rather, it is one factor in determining whether it would be appropriate to install a new traffic signal. Other factors include the actual delay experienced by vehicles turning from the minor street to the major street, proximity to other signalized intersections, traffic progression on a synchronized corridor, whether the new signal would encourage traffic to pass through sensitive neighborhoods, and safety considerations.

## **FREEWAY OFF-RAMP QUEUES**

The Project would not cause or contribute to excessive queuing at the Caltrans off-ramps.

## **RECOMMENDED IMPROVEMENTS**

As detailed above, Intersection #2, E. Grand Boulevard & Quarry Street, meets the peak hour signal warrant. However, since the vast majority of the turns from Quarry Street to E. Grand Boulevard are right turns that are forecast to experience less than 20 seconds of delay per vehicle,<sup>5</sup> there does not appear to be a significant need for a traffic signal at this location to improve operations. As a result, it is not recommended for implementation.

As described earlier, the Project assumes right-turn in/out only driveway access at: Intersections #6, E. Grand Boulevard & Kress Court, #8, Kress Court & E. Sixth Street, and #12, Park Driveway (east) & E. Sixth Street. The installation of a “porkchop” island treatments and appropriate signage

---

<sup>5</sup> See Table 11A.

are recommended at these locations (within the public right-of-way) to reinforce the right-turn restrictions.<sup>6</sup>

City staff have indicated that changes to the Corona Cruiser are being planned, with re-routing to expand service on E. Sixth Street between Rimpau Avenue and E. Grand Boulevard. The installation of transit vehicle turnout(s) along the Project's E. Sixth Street frontage (within the public right-of-way and to the City's standard design) is recommended to accommodate the future transit service expansion.

---

<sup>6</sup> The timing of the *Downtown Revitalization Plan's* raised median along E. Sixth Street has not yet been identified. To the extent it is constructed prior to completion of the Project, this recommended improvement may not be necessary.

---

## **Chapter 7**

### **Site Access Analysis**

The Project Site would be served by six driveways to publicly accessible parking areas, along with one service driveway (not analyzed) providing commercial loading and trash pick-up access. The driveway locations and turn restrictions at each driveway are summarized in Table 2. All six analyzed driveways are unsignalized and are projected to operate at LOS C or better during each peak period under the Future with Project condition, as shown in Table 11A. There would be minimal queuing at each driveway due to low numbers of vehicles arriving and departing, turn restrictions, and, for driveways on Quarry Street and Rimpau Avenue, low adjacent street traffic.

Three of the six analyzed driveways are located on Collectors, including two on Quarry Street and one on Rimpau Avenue. The three remaining driveways, one on E. Grand Boulevard and two on E. Sixth Street, are located on Arterial Streets. All six driveways are oriented perpendicular to the adjacent roadways and provide good visibility in both directions. The two driveways on E. Sixth Street and the two driveways on Quarry Street are far enough apart that they pose no risk of interfering with each other.

The driveways on E. Grand Boulevard and E. Sixth Street are assumed to operate with only right turns in and out of the Project Site. Based on the Project-only traffic volume forecasts shown in Exhibits 10A and 10B, the maximum forecasted entering Project volume at each arterial driveway is under the threshold of 50 peak hour trips identified in the TIS Guidelines for warranting the installation of a right-turn deceleration lane. As described in Chapter 6, the installation of “porkchop” island treatments and appropriate signage at these driveways is recommended to reinforce the right-turn only restrictions.

Finally, the Project Site plan routes internal pedestrian paths away from access points and parking areas. Therefore, there are no internal pedestrian-vehicle conflict points.

Overall, the Project Site access plan appropriately distributes traffic and parking through the site and allows for a safe and comfortable experience for drivers and pedestrians.
