

# THIN-LINE® Weld Heads

AMADA WELD TECH's THIN-LINE Heads for spot welding applications comprise three families of full-featured products for resistance spot welding: TL-080B Series (0.25 lb (1N) - 40 lbs (178N)), and TL-180B Series (100 lb (445 N)). All are precision, low inertia, force-fired designs, with narrow vertical profiles. Inline and parallel gap spot welding configurations available. Ideal for both production line and benchtop applications, THIN-LINE weld heads can operate at speeds greater than 3600 welds per hour.

## KEY FEATURES

- Low inertia, fast follow-up designs improve weld consistency, reduce metal expulsion, and improve weld appearance
- Adjustable force firing ensures weld force is independent of electrode stroke length resulting in higher quality welds
- EZ-AIR® technology ensures force consistency and simplifies set-up
- Rugged industrial design improves productivity, minimizes repair costs and ensures long life
- Pneumatic or manual actuation

## TYPICAL APPLICATIONS

*Magnet wire to terminal*

*Coin cell battery tab*

*Honeycomb tacking*

## PRECISION PERFORMANCE THROUGH INTELLIGENT DESIGN

### The THIN-LINE Ranges

AMADA WELD TECH's THIN-LINE Weld Heads consist of two families of full-featured products for precision metals joining:

**TL-080B Series** – 0.25 to 20 lbs. (1.1 to 89 N)  
4 to 40 lbs. (18 to 178 N)

**TL-180B Series** – 5 to 100 lbs. (22 to 445 N)

### Durable High Quality Design

Rugged construction, linear ball bearing bushings and an over-sized, anti-rotation bearing system provide perfect linear travel of the upper electrode arm. This system minimizes the potential for electrode wiping action during the weld, even at maximum force settings. Based on actual test data,

bearing life exceeds 25 million operations when used according to the specifications.

### High Speed Capability

EZ-AIR ensures repeatable, reliable, high-speed operation in automated applications. Threaded holes on the back of the heads make them easy to mount, without their post or base, in automated work stations. EZ-AIR provides unsurpassed repeatability and ease of set-up.

### Precision Control

THIN-LINE Weld Heads add consistency and control to complex welding applications. Their low inertia designs ensure the fast dynamic response

required for the electrodes to follow the minute expansion and contraction of the weld joint as it heats and cools. A differential motion force-firing system initiates the welding control at the precise moment when the pre-set electrode force is applied to the workpieces.

### Electrodes and Accessories

A complete line of accessories and electrodes are available. Optics are available for all heads. All heads are supplied with firing switch cables, mounting hardware, and one set of electrodes.

## ELECTRODE CONFIGURATIONS MATCH SPECIFIC APPLICATION NEEDS

### Opposed Configuration

Top and bottom electrodes are used to hold the parts and provide the current path. An opposed weld is preferred over other configurations because it is easier to set-up and control the current path. It should be used whenever possible.

*Opposed weld*

### Step Configuration

THIN-LINE weld heads designed for series welding can also be set up in a step configuration. Two top electrodes are used, but one electrode contacts the top part and the other electrode contacts the bottom part. A single weld is produced at the part to part interface. Independent force control allows the electrode force on the bottom part to be set much higher than the force on the top part.

*Step weld*

### Series Configuration

Using two top electrodes, a series weld can be used when there is no access to the bottom part. Both electrodes contact the top part and current is passed through the top part to the bottom part. Two weld spots are produced, one under each electrode. Independent force control allows for separate adjustment of each electrode force and is used to balance the heat between the two weld spots.

*Series weld*

### Parallel Gap Configuration

Parallel gap welding results in a single weld spot under the gap between the electrodes. It is used to weld very small parts. Two styles of parallel gap electrodes are available: UNITIPS® which are permanently bonded together with an insulating spacer and fixed gap; and UNIBOND® Electrodes which allow for adjustment of the gap.

*Parallel gap weld*

## HIGH QUALITY, FULL FEATURED

All AMADA WELD TECH weld heads are subjected to environmental life testing designed to guarantee specifications and performance.

Air actuated weld heads are supplied with an EZ-AIR force control module. The air actuation system includes a linear spring which ensures proper operation at low forces. EZ-AIR provides high repeatability and eliminates overforce. The air systems can be moved to other locations when the heads are incorporated in work stations or automated systems. The heads can be supplied with an optional Hall Effect Limit Switch Kit, which will detect when the head is in the up or down position. This feature can prevent damage when automated machine tooling is indexed.

## TL-080B SERIES DESIGN FEATURES

# TL-080B SERIES THIN-LINE WELD HEADS – Force Range 0.25 to 20 Lbs. (1.1 to 89 N)

See page 7 for EZ-AIR specifications

EZ-AIR can be set for 24VDC operation

Offset/opposed

## EZ-AIR TECHNOLOGY

The EZ-AIR weld force control system simplifies the set-up process to a single adjustment and helps prevent weld over-force by closing off the input air when the actual weld force reaches the programmed weld force level, delivering accurate force control which is repeatable across multiple weld heads without complex setup or operator training.

- Firing force is important because it controls contact resistances and, therefore, heat generation at the electrode-to-part and part-to-part interface.
- Superior force control = process stability and higher production yield with reduced maintenance time.

**Figure 1**, above, shows an incorrect balance of firing force to air pressure set by an operator after cleaning the electrodes, on a traditional weld head, resulting in poor set-up and force control.

**EZ-AIR insures correct set-up and good force control as seen in Figure 2**, above. EZ-AIR requires no balancing of air pressure as the air pressure is constant once the firing force is reached.

The following series of simplified diagrams explain how the EZ-AIR weld force control system works through independent control of upper and lower air chambers.

**Electrode up position** – air pressure in the lower chamber keeps the piston in the up position. Waste air exhausts from the upper chamber.

**Electrode moves down** – air pressure in the upper chamber forces the piston down. Waste air exhausts from the lower chamber.

**Electrode reaches weld force** – both solenoid valves close within 4ms and air pressure is trapped in both the upper and lower chambers. Weld force remains constant since the air cylinder piston cannot move. Compression spring provides instantaneous follow-up.

**EZ-AIR force control technology is available with AMADA WELD TECH THIN-LINE weld heads as original equipment and as a retrofit for previously purchased THIN-LINE air actuated weld heads. See the Ordering Guide for more information.**

## THIN-LINE WELD HEAD ORDERING GUIDE
