VAPOR CONTROL SYSTEM INSTALLATION

FOR BARGES: "7027" AND "7028"

CONOCO, INC.

I. INTENT AND TECHNICAL APPROACH

The enclosed information is being submitted to obtain approval for the installation and use of a vapor control system. The information is structured to address (1) the regulations of 33 CFR Parts 154, 155, 156, and 46 CFR Parts 30, 32, 35, and 39 as revised and amended June 21, 1990 (re: gasoline, crude oil, and benzene) and (2) the guidelines of the enclosure to USCG letter of 24 August 1993 and as revised 20 September 1993 (i.e., GUIDELINES FOR DETERMINING THE MAXIMUM LIQUID TRANSFER RATE FOR A TANK VESSEL TRANSFERRING A FLAMMABLE OR COMBUSTIBLE CARGO USING A VAPOR CONTROL SYSTEM). It is desired that U.S.C.G. authorize use of the vapor control system with all 46 CFR Subchapter "O" and "D" cargoes for which the system meets applicable regulations (e.g., benzene, gasoline, and crude oil) as well as other U.S.C.G. "inhouse" guidelines.

The technical approach used herein to determine maximum liquid transfer rate imposed by (a) the capacity of the cargo tank venting system [see 46 CFR 39.20-11] and (b) the pressure drop between the most remote tank and the shore connection [see 46 CFR 39.30-1(D)(3)] is summarized as follows:

1. Pertinent vessel and piping system parameters are obtained for (a) maximum design working pressure, (b) pressure vacuum valve setting and flow characteristics, and (c) piping system parameters (see APPENDIX E-1).

2. Cargoes for which the vapor control system is to be used are identified (see APPENDIX E-2).

3. Cargo data is obtained for (a) USCG vapor control system category, (b) specific gravity of cargo vapor, and (c) saturated vapor pressure at 115 degrees F (see APPENDIX E-2).

4. The vapor-air mix density, specific gravity, and growth rate (VGR) are determined for each cargo for which adequate data is available (see APPENDIX E-2).

II. BARGE TYPE AND DESCRIPTION:

The vessels of concern are a 297'-6" X 54'-0" X 12'-0", double side, double bottom, tank barges intended for service on rivers, lakes, bays and sounds. They are equipped with a raked end and a box end. Each barge has six (6) cargo tanks, and is served by a cargo pump, and a transverse load and unload header.

III. INDIVIDUAL BARGE DATA:

NAME	BUILDER	HULL
7027	TRINITY/ASHLAND CITY	4317
7028	TRINITY/ASHLAND CITY	4318

IV. CARGO PRODUCT(S):

The vapor control system is to be used with cargo product(s) listed in APPENDIX E and as otherwise authorized by U.S.C.G.

V. CARGO HOSES:

The vessels will not carry cargo vapor hoses. Accordingly, and with reference to 46 CFR 39.30-1(c), hoses are not included in the pressure drop calculations presented by this analysis.

VI. MAXIMUM DESIGN WORKING PRESSURE:

Per previous documentation the barge structure is reported to be suitable for a 3.0 PSIG MAXIMUM DESIGN WORKING PRESSURE.

(Note: This MAXIMUM DESIGN WORKING PRESSURE is considered appropriate for both pressure and vacuum conditions.)

VII. MAXIMUM LIQUID TRANSFER RATE:

The maximum liquid transfer rate (MLTR) is to be 5,000 BBL/HR unless otherwise limited by (1) the max capacity of the cargo tank venting system (see APPENDIX E-3), or (2) by the sum of the "shore connection pressure" plus the "pressure drop" from the most remote tank to the shore connection being in excess of 80% of the P/V setting as determined from the graphs of APPENDIX G for specific loading conditions.

5. The pressure drop across the PV valve, piping system losses, pressure at the tank most remote from the PV valve, and MAXIMUM LIQUID TRANSFER RATE as limited by the vapor control system are determined (see APPENDIX E-3).

   These parameters are based on a vapor-air mix flow rate of "VGR" times a "liquid transfer rate" equal to the lesser of 5,000 BBL/HR (i.e., an owner/operator criteria) or the maximum flow rate which results in a pressure at the most remote tank not exceeding the cargo tank MAXIMUM DESIGN WORKING PRESSURE (see SECTION VI below).

6. A set of graphs is developed for various values of vapor growth rate (VGR) (see APPENDIX G). The values of VGR bracket the values determined in the above described analysis. Each set consists of five graphs - i.e., one graph for each of five conditions of pressure at the shore connection loading header ranging from -1.0 PSIG to 1.0 PSIG. Each graph shows the relationship between the "pressure drop" from the most remote tank to the shore connection and the "liquid flow rate" for a range of cargo vapor-air specific gravity. The pressure drop is based on a vapor-air mix flow rate of "VGR" times the noted liquid transfer rate.

   Each graph page contains a description of the intended procedure for its use.

   APPENDIX F provides a detailed illustration of the pressure drop calculation process.

   APPENDIX H provides a detailed listing by cargo of the pressure drop from the most remote tank to the shore connection for a 1.0 PSIG pressure at the shore connection.

VIII. VAPOR CONTROL SYSTEM (46 CFR 39.20-1):

FIGURE 1 and TABLE LM-1 provide a diagram and list of material, respectively, of the vapor control system and related equipment.

When the vapor control system is to be used:

A. Pressure/vacuum valves (if any) other than the vapor control system pressure/vacuum valve(s) will be removed and the connections sealed with standard threaded pipe caps or equal.

B. Above-deck vapor piping will be lettered and painted in accordance with 46 CFR 39.20-1(d).

C. The shore connection flange will be in accordance with 46 CFR 39.20-1(f).

IX. CARGO GAUGING SYSTEM:

A. One (1) visual tank level indicator (i.e., sight glass) will be installed at the access hatch to each cargo tank to provide liquid level determination in accordance with 46 CFR 39.20-3(a). Descriptive literature is provided in TABLE LM-1 and in APPENDIX A.

B. One (1) high level indicating device (i.e., dipstick) will be installed in each cargo tank to indicate when the liquid level in the cargo tank is within about 3.28 feet of the tank top in accordance with 46 CFR 39.20-3 (b). Descriptive literature is provided in TABLE LM-1 and in APPENDIX B.

X. LIQUID OVERFILL PROTECTION (46 CFR 39.20-9):

Primary tank barge liquid overfill protection will be provided by installation of a high level alarm/shutdown system which complies with the requirements of 46 CFR 39.20-9 (b). Additional tank barge liquid overfill protection will be provided by installation of spill valves which comply with the requirements of 46 CFR 39.20-9(d). Each spill valve will serve two (2) cargo tanks (P/S) by use of an adapter. Descriptive literature on both protection measures is provided in TABLE LM-1 and in APPENDIX C.

Calculations for the allowable flow of the spill valve (without exceeding the MAX DESIGN WORKING PRESSURE) are provided as APPENDIX I; however, these flow rates do not govern the MAX LIQUID TRANSFER RATE since primary liquid overfill protection is provided by the high level alarm and shutdown system.

APPENDIX J provides a summary comparison of the spill valve and the P/V transfer rates.

XI. VAPOR OVERPRESSURE AND VACUUM PROTECTION (46 CFR 39.20-11):

To satisfy the requirements of 46 CFR 39.20-11, the cargo tank venting system is to be fitted with one (1) pressure vacuum relief valve. Descriptive literature is provided in TABLE LM-1 and in APPENDIX D. It will be installed in the above deck vapor control piping.

A. VAPOR OVERPRESSURE (LOADING) PROTECTION

APPENDIX E develops the maximum liquid (cargo loading) transfer rate for which the pressure in the cargo tank most remote from the P/V valve does not exceed the MAXIMUM DESIGN WORKING PRESSURE. The calculations therein are in general accordance with the USCG-provided GUIDELINES FOR DETERMINING THE MAXIMUM LIQUID TRANSFER RATE FOR A TANK VESSEL TRANSFERRING A FLAMMABLE OR COMBUSTIBLE CARGO USING A VAPOR CONTROL SYSTEM.

B. VAPOR VACUUM PROTECTION

It is possible that cargo loading may suddenly be stopped while the shore facility compressor continues to draw a vacuum. In that instance, the P/V valve is required to have sufficient vacuum capability to intake air in quantity equal to the MAXIMUM LIQUID TRANSFER RATE at a pressure (vacuum) which does not exceed the MAXIMUM DESIGN WORKING VACUUM.

With reference to the vacuum curve information in APPENDIX D, the P/V valve has the following vacuum capacity at a vacuum of -1.0 PSIG, a pressure which is less than the -3.0 PSIG MAXIMUM DESIGN WORKING VACUUM:

CARGO PRODUCT WITH HIGHEST REQ'D AIR FLOW RATE	HIGHEST REQUIRED AIR FLOW RATE (MATR)		PV VALVE VACUUM CAPACITY AIR	
	(BBL/HR)	(FT^3/HR)	(BBL/HR)	(FT^3/HR)
VARIOUS	5,000	28,074	5,877	33,000

Since the capacity at higher vacuum exceeds the highest required air flow rate, the cargo tank venting system will:

a. Prevent a vacuum in the cargo tank vapor space, whether generated by withdrawal of cargo or vapor at maximum rates, that exceeds the MAXIMUM DESIGN WORKING VACUUM for any tank connected to the vapor collection system; and

b. Not relieve at a vacuum corresponding to a vacuum in the cargo tank vapor space of less than 0.5 PSIG below atmospheric pressure.

XII. OPERATIONAL REQUIREMENTS (46 CFR 39.30-1):

To satisfy the requirements of 46 CFR 39.30-1(b) and (d), data is developed showing the relationship between "pressure drop" through the vapor control system from the most remote cargo tank to the vessel shore connection and "liquid transfer rate" for various values of vapor-air mix growth rate, vapor-air mix specific gravity, and pressure at the shore connection.

Detailed support calculations for the data are voluminous, and repetitive. Accordingly, an illustrative sample calculation and graph (vice complete calculations and graphs for all individual products) are provided as APPENDIX F. The calculation procedure is in general accordance with the USCG-provided GUIDELINES FOR DETERMINING THE MAXIMUM LIQUID TRANSFER RATE FOR A TANK VESSEL TRANSFERRING A FLAMMABLE OR COMBUSTIBLE CARGO USING A VAPOR CONTROL SYSTEM. Output results from the complete calculations are presented in the graphs of APPENDIX G. Further, a listing is provided, by cargo, of the pressure drop from the most remote cargo tank to the shore connection for a 1.0 PSIG pressure at the shore connection. Descriptive literature similar to those graphs and table is to be included in the vessel "TRANSFER PROCEDURES" by the owner-operator.

VAPOR CONTROL SYSTEM INSTALLATION

FOR BARGES: "7027" AND "7028"

CONOCO, INC.

A FOR TRANSFER RATE VS PRESSURE DROP

NOTES:

a. 46 CFR 39.30.1 (b) REQUIRES THAT, FOR GASOLINE, CRUDE OIL, AND BENZENE, PRESSURE DROP THROUGH THE VAPOR COLLECTION SYSTEM FROM THE MOST REMOTE CARGO TANK TO THE VESSEL VAPOR CONNECTION MUST BE DETERMINED BASED ON A 50 PERCENT CARGO VAPOR AND AIR MIXTURE. PER DALTON'S LAW OF PARTIAL PRESSURES, AND ASSUMING THE MIXTURE IS 50/50 BY VOLUME, THE SPECIFIC GRAVITY OF THE MIXTURE CAN BE DETERMINED AS FOLLOWS:
SGmix = { (N/2) * MWair } + { (N/2) * MWcargo} / (N * MWair) WHERE
N = TOTAL NO. MOLECULES PER UNIT VOLUME
MWair = MOLECULAR WEIGHT OF AIR
MWcargo = MOLECULAR WEIGHT OF CARGO VAPOR
SGmix = 0.5 * (MWair + MWcargo) / MWair
A CORRESPONDING RELATIONSHIP IN TERMS OF SPECIFIC GRAVITY IS:
SGmix = (SGair + SGcargo) / 2
FOR PRODUCTS OTHER THAN THOSE CITED ABOVE, THE SPECIFIC GRAVITY OF THE MIX CAN BE DETERMINED AS:
SGmix = Wv-a,115 / Wa,115 WHERE
Wv-a,115 = VAPOR-AIR MIX WEIGHT DENSITY, & Wa-115 = AIR WEIGHT DENSITY, BOTH AT 115 DEG F.

b. THE SPECIFIC WEIGHT OF THE VAPOR/AIR MIXTURE IS OBTAINED BY MULTIPLYING THE SPECIFIC GRAVITY OF THE VAPOR/AIR MIXTURE BY THE WEIGHT OF AIR AS OBTAINED FROM THE FORMULA IN CRANE T.P. 410 (PAGE A-10) [I.E., Ws =(M * P) / (10.72 *T) WHERE M IS THE MOLECULAR WEIGHT OF AIR (28.97), P IS PRESSURE IN PSIA (SEE BELOW), AND T IS ABSOLUTE TEMPERATURE IN RANKINE (F + 460) WITH T = 115 DEGREES FAHRENHEIT PER USCG GUIDANCE.

IF (P1 - P2)/P1 < 10% THE ASSUMPTION THAT Ws = Ws1 = Ws2 (WITH Ws2 EVALUATED @ P2) CAN BE CONSIDERED TO BE APPROPRIATE; OTHERWISE, A SECOND ITERATION SHOULD BE PERFORMED USING Ws = Wsav = (Ws1 +Ws2)/2 (WITH Ws1 EVALUATED @ P1 AND Ws2 @ P2).

c. THE PRECISE VISCOSITY OF THE CARGO VAPOR-AIR MIXTURE IS NOT KNOWN; HOWEVER, THE VISCOSITY OF AIR @ 100 DEGREES F IS 0.019 CENTIPOISE (SEE CRANE T.P. 410 (PAGE A-5). FOR PURPOSES OF THESE CALCULATIONS, ASSUMPTION THAT THE VISCOSITY OF THE CARGO-AIR MIXTURE IS THAT OF AIR AT 100 DEGREES F IS CONSIDERED REASONABLE.
FOR REFERENCE AND COMPARISON, REPRESENTATIVE VALUES OF ABSOLUTE (DYNAMIC) VISCOSITY OF VARIOUS HYDROCARBON VAPOR AND NATURAL GASES MAY BE FOUND IN CRANE T.P. 410 (PAGE A-5).

d. "LENGTH" IS THE DISTANCE BETWEEN THE MOST REMOTE CARGO TANK VAPOR INLET AND THE VESSEL'S VAPOR CONNECTION, AND IS ESTIMATED CONSERVATIVELY HIGH.

BEND HEAD LOSS ASSUMES	QTY	LOSS COEFF.		QT	LOSS COEFF.
SECTION I:					
TEE (THRU RUN)	3	0.60	90 DEG EL L.R.1		0.75

13. USCG VAP COLLECT'N SYS. CARGO CATEGORIES
    1. NO ADD'L VCS REQMNTS ABOVE THOSE FOR BENZENE, GASOLINE & CRUDE OIL
    2. POLYMERIZES
    3. HGHLY TOXIC
    4. POLYMERIZES & HIGHLY TOXIC
    5. HIGH VAPOR GROWTH RATE
    6. HIGH VAP GROWTH RATE & HIGHLY TOXIC
    7. HIGH VAP GROWTH RATE & POLYMERIZES
    8. MORE INFO NEEDED BEFORE REQMNTS CAN BE DETERMINED
14. VGR = 1.25 FOR GASOLINE, CRUDE OIL, AND BENZENE.
15. NF/NC = NON-FLAMMABLE/NON-COMBUSTIBLE

BARGE: C9809: CONOCO, INC.; "7027" AND "7028"

(SEE "TABLE IV" FOR APPLICABLE CONDITIONS)
