**for**  
**DOUBLE SKIN TANK BARGES "7031" AND "7032"**

**I. INTENT AND TECHNICAL APPROACH**

The enclosed information is being submitted to obtain approval for the installation and use of a vapor control system. The information is structured to address (1) the regulations of 33 CFR Parts 154, 155, 156 and 46 CFR Parts 30, 32, 35 and 39 as revised and amended June 21, 1990 (re: gasoline, crude oil and benzene) and (2) the guidelines of the enclosure to USCG letter of 24 August 1993 and as revised 20 September 1993 (i.e. GUIDELINES FOR DETERMINING THE MAXIMUM LIQUID TRANSFER RATE FOR A TANK VESSEL TRANSFERRING A FLAMMABLE OR COMBUSTIBLE CARGO USING A VAPOR CONTROL SYSTEM). It is desired that U.S.C.G. authorize use of the vapor control system with all 46 CFR Subchapter "O" and "D" cargoes for which the system meets applicable regulations (e.g. benzene, gasoline and crude oil) as well as other U.S.C.G. "in-house guidelines.

The technical approach used herein to determine maximum liquid transfer rate imposed by (a) the capacity of the cargo tank venting system (see 46 CFR 39.20-11), and (b) the pressure drop between the most remote tank and the shore connection (see 46 CFR 39.30-1(d)(3)) is summarized as follows:

1. Pertinent vessel and piping system parameters are obtained for (a) maximum design working pressure, (b) pressure vacuum valve setting and flow characteristics, and (c) piping system parameters (see APPENDIX E-1).
2. Cargoes for which the vapor control system is to be used are identified (see APPENDIX E-2).
3. Cargo data is obtained for (a) USCG vapor control system category, (b) specific gravity of cargo vapor and (c) saturated vapor pressure at 115 degrees F (see APPENDIX E-2).
4. The vapor-air mix density, specific gravity, and growth rate (VGR) are determined for each cargo for which adequate data is available (see APPENDIX E-2).

5. The pressure drop across the PV valve, piping system losses, pressure at the tank most remote from the PV valve, and MAXIMUM LIQUID TRANSFER RATE as limited by the vapor control system are determined (see APPENDIX E-3).

These parameters are based on a vapor-air mix flow rate of "VGR" times a "liquid transfer rate" equal to the lesser of 5,000 BBL/HR (i.e., an owner/operator criteria) or the maximum flow rate which results in a pressure at the most remote tank not exceeding the cargo tank MAXIMUM DESIGN WORKING PRESSURE (see SECTION VI below).

6. A set of graphs is developed for various values of vapor growth rate (VGR) (see APPENDIX G). The values of VGR bracket the values determined in the above described analysis. Each set consists of five graphs - i.e., one graph for each of five conditions of pressure at the shore connection loading header ranging from -1.0 PSIG to 1.0 PSIG. Each graph shows the relationship between the "pressure drop" from the most remote tank to the shore connection and the "liquid flow rate" for a range of cargo vapor-air specific gravity. The pressure drop is based on a vapor-air mix flow rate of "VGR" times the noted liquid transfer rate.

Each graph page contains a description of the intended procedure for its use.

APPENDIX F provides a detailed illustration of the pressure drop calculation process.

APPENDIX H provides a detailed listing by cargo of the pressure drop from the most remote tank to the shore connection for a 1.0 PSIG pressure at the shore connection.

## II. BARGE TYPE AND DESCRIPTION:

Each of the two (2) vessels of concern is a 240'-0" X 42'-0" X 12'-0" double skin tank barge intended for service on rivers, lakes, bays and sounds. Each barge is equipped with a raked end and a box end. Each barge has six (6) cargo tanks, and is served by a cargo pump, and a transverse load and unload header.

## III. INDIVIDUAL BARGE DATA:

<u>NAME</u>	<u>BUILDER</u>	<u>HULL NUMBER</u>
7031	Trinity/Madisonville	2109-1
7032	Trinity/Madisonville	2109-2

## IV. CARGO PRODUCT(S):

The vapor control system is to be used with cargo product(s) listed in APPENDIX E and as otherwise authorized by U.S.C.G.

## V. CARGO HOSES:

The vessel will not carry cargo vapor hoses. Accordingly, and with reference to 46 CFR 39.30-1(c), hoses are not included in the pressure drop calculations presented by this analysis.

## VI. MAXIMUM ALLOWABLE WORKING PRESSURE (MAWP):

Per previous documentation, the barge structure is designed for a maximum allowable working pressure (MAWP) of 3.0 psig.

(Note: This maximum allowable working pressure is considered appropriate for both pressure and vacuum conditions.)

## VII. MAXIMUM LIQUID TRANSFER RATE:

The maximum liquid transfer rate (MLTR) is to be 5,000 BBL/Hr unless otherwise limited by (1) the maximum capacity of the cargo tank venting system (see APPENDIX E-3) or (2) by the sum of the "shore connection pressure" plus the "pressure drop" from the most remote tank to the shore connection being in excess of 80% of the P-V valve setting as determined from the graphs of APPENDIX G for specific loading conditions.

VIII. VAPOR CONTROL SYSTEM (46 CFR 39.20-1):

FIGURE 1 and TABLE LM-1 provide a diagram and list of material, respectively, of the vapor control system and related equipment.

When the vapor control system is to be used:

A. Pressure/vacuum valves (if any) other than the vapor control system pressure/vacuum valve(s) will be removed and the connections sealed with standard threaded pipe caps or equal.

B. Above-deck vapor piping will be lettered and painted in accordance with 46 CFR 39.20-1(d).

C. The shore connection flange will be in accordance with 46 CFR 39.20-1(f).

IX. CARGO GAUGING SYSTEM:

A. One (1) visual tank level indicator (i.e., sight glass) will be installed at the access hatch to each cargo tank to provide liquid level determination in accordance with 46 CFR 39.20-3(a). Descriptive literature is provided in TABLE LM-1 and in APPENDIX A.

B. One (1) high level indicating device (i.e., dipstick) will be installed in each cargo tank to indicate when the liquid level in the cargo tank is within about 3.28 feet of the tank top in accordance with 46 CFR 39.20-3 (b). Descriptive literature is provided in TABLE LM-1 and in APPENDIX B.

X. LIQUID OVERFILL PROTECTION (46 CFR 39.20-9):

Primary tank barge liquid overfill protection will be provided by installation of a high level alarm/shutdown system which complies with the requirements of 46 CFR 39.20-9 (b). Additional tank barge liquid overfill protection will be provided by installation of spill valves ~~installed over rupture disks~~ which comply with the requirements of 46 CFR 39.20-9(d). Each spill valve will serve two (2) cargo tanks (P/S) by use of an adapter. Descriptive literature on both protection measures is provided in TABLE LM-1 and in APPENDIX C.

Calculations for the allowable flow of the spill valve (without exceeding the MAX DESIGN WORKING PRESSURE) are provided as APPENDIX I; however, these flow rates do not govern the MAX LIQUID TRANSFER RATE since primary liquid overfill protection is provided by the high level alarm and shutdown system.

APPENDIX J provides a summary comparison of the spill valve and the P/V transfer rates.

XI. VAPOR OVERPRESSURE AND VACUUM PROTECTION (46 CFR 39.20-11):

To satisfy the requirements of 46 CFR 39.20-11, the cargo tank venting system is to be fitted with one (1) pressure vacuum relief valve. Descriptive literature is provided in TABLE LM-1 and in APPENDIX D. It will be installed in the above deck vapor control piping.

A. VAPOR OVERPRESSURE (LOADING) PROTECTION

APPENDIX E develops the maximum liquid (cargo loading) transfer rate for which the pressure in the cargo tank most remote from the P/V valve does not exceed the MAXIMUM DESIGN WORKING PRESSURE. The calculations therein are in general accordance with the USCG-provided GUIDELINES FOR DETERMINING THE MAXIMUM LIQUID TRANSFER RATE FOR A TANK VESSEL TRANSFERRING A FLAMMABLE OR COMBUSTIBLE CARGO USING A VAPOR CONTROL SYSTEM.

B. VAPOR VACUUM PROTECTION

It is possible that cargo loading may suddenly be stopped while the shore facility compressor continues to draw a vacuum. In that instance, the P/V valve is required to have sufficient vacuum capability to intake air in quantity equal to the MAXIMUM LIQUID TRANSFER RATE at a pressure (vacuum) which does not exceed the MAXIMUM DESIGN WORKING VACUUM.

With reference to the vacuum curve information in APPENDIX D, the P/V valve has the following vacuum capacity at a vacuum of -1.0 PSIG, a pressure which is less than the -3.0 PSIG MAXIMUM DESIGN WORKING VACUUM:

CARGO PRODUCT WITH HIGHEST REQ'D AIR FLOW RATE	HIGHEST REQUIRED AIR FLOW RATE (MATR) (BBL/HR)	PV VALVE VACUUM CAPACITY AIR (BBL/HR)
VARIOUS	5,000      28,074	5,877      33,000

Since the capacity at higher vacuum exceeds the highest required air flow rate, the cargo tank venting system will:

a. Prevent a vacuum in the cargo tank vapor space, whether generated by withdrawal of cargo or vapor at maximum rates, that exceeds the MAXIMUM DESIGN WORKING VACUUM for any tank connected to the vapor collection system; and

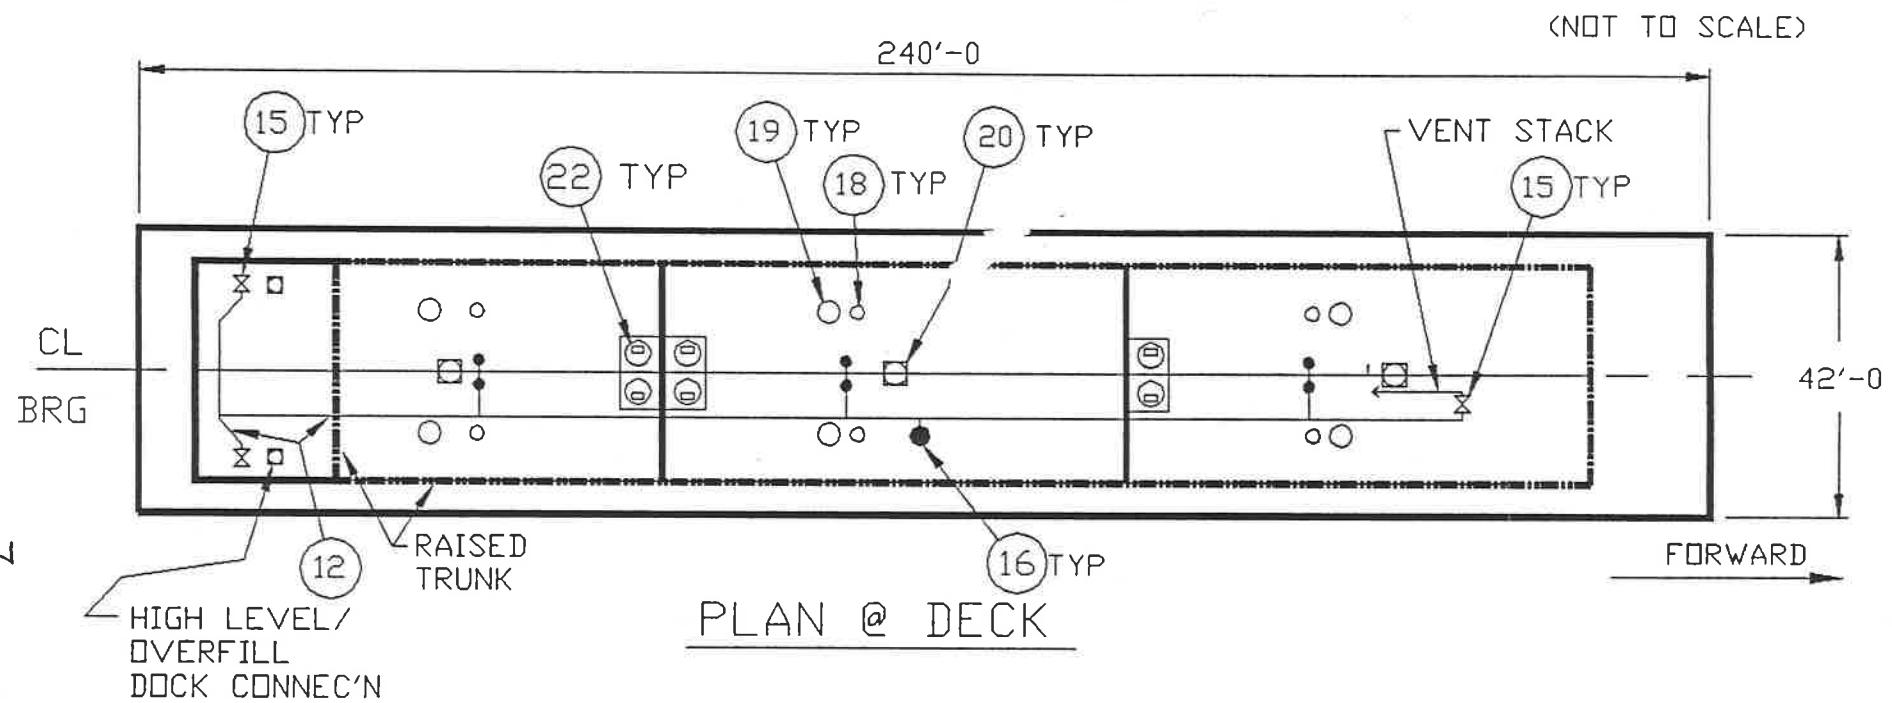

b. Not relieve at a vacuum corresponding to a vacuum in the cargo tank vapor space of less than 0.5 PSIG below atmospheric pressure.

XII. OPERATIONAL REQUIREMENTS (46 CFR 39.30-1) :

To satisfy the requirements of 46 CFR 39.30-1(b) and (d), data is developed showing the relationship between "pressure drop" through the vapor control system from the most remote cargo tank to the vessel shore connection and "liquid transfer rate" for various values of vapor-air mix growth rate, vapor-air mix specific gravity, and pressure at the shore connection.

Detailed support calculations for the data are voluminous, and repetitive. Accordingly, an illustrative sample calculation and graph (vice complete calculations and graphs for all individual products) are provided as APPENDIX F. The calculation procedure is in general accordance with the USCG-provided GUIDELINES FOR DETERMINING THE MAXIMUM LIQUID TRANSFER RATE FOR A TANK VESSEL TRANSFERRING A FLAMMABLE OR COMBUSTIBLE CARGO USING A VAPOR CONTROL SYSTEM. Output results from the complete calculations are presented in the graphs of APPENDIX G. Further, a listing is provided, by cargo, of the pressure drop from the most remote cargo tank to the shore connection for a 1.0 PSIG pressure at the shore connection. Descriptive literature similar to those graphs and table is to be included in the vessel "TRANSFER PROCEDURES" by the owner-operator.

Jan '75

**ERL ERL  
MARINE PRODUCTS DIVISION**

# MARINE SIGHT GLASS

**U.S. PATENT NO. 5,284,105**

**FULL-VIEW  
Model SGM-1**

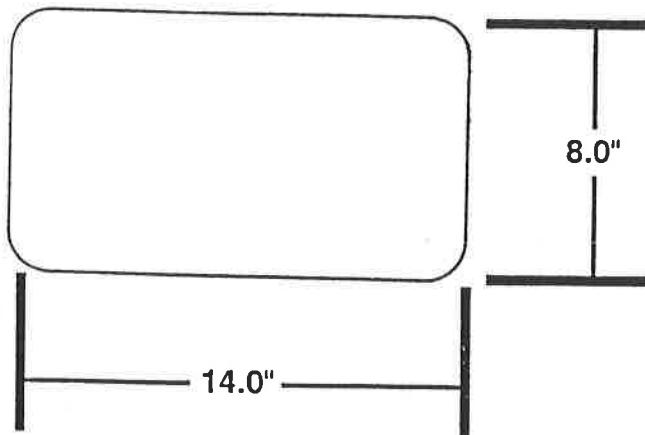

You will notice immediately that ERL has done something radically different with the new SGM-1. Starting with a "clean sheet of paper" and state-of-the-art CAD technology ERL set out to create a marine sight glass that would be better than the best. The SGM-1 gives the largest and clearest sealed-view into your cargo hold, for the money, of any marine sight glass on the market.

## COMPARE THESE FEATURES TO THE OTHER MARINE SIGHT GLASSES.

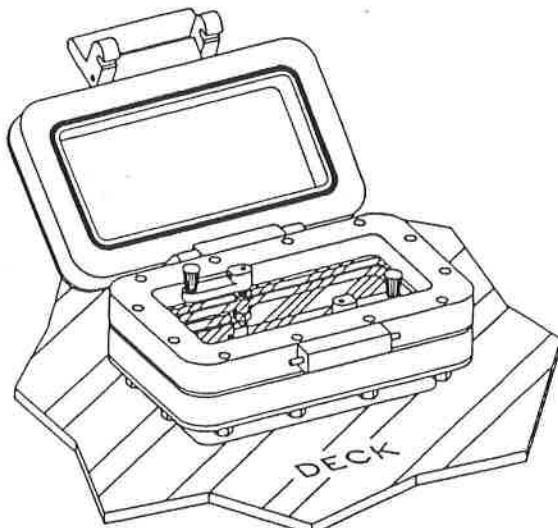

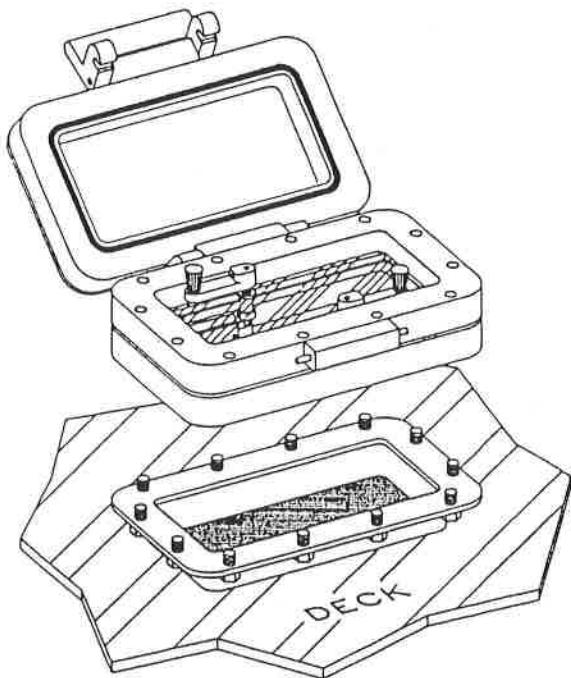

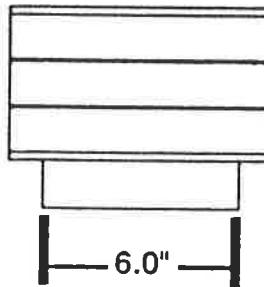

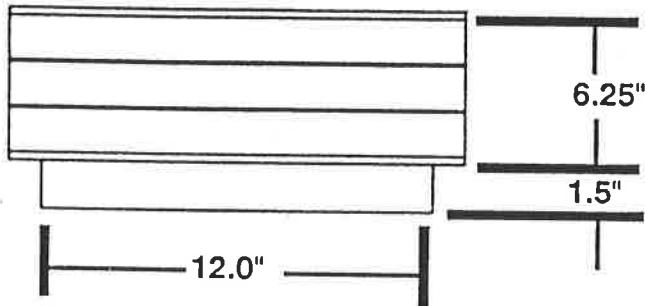

- \* A full 59 Sq. Inches of viewing area (34 Sq. Inches is wiped). Wiper blades can be readily changed and are standard size, off-the-shelf, Viton or EPDM "O" rings.
- \* 3/4" thick #7740 Pyrex ground and polished plate glass is stress relieved with ground edges and radiused corners.
- \* The SGM-1 and all mounting hardware is 303 Stainless Steel except for the aluminum glass cover and the carbon-steel deck mounting flange. All gaskets (supplied) are industrial quality Teflon or Buna N.
- \* The SGM-1 is the easiest, safest and most economical way to comply with USCG regulations on Marine Vapor Control Systems by giving the clearest visual gaging/inspection of your cargo.
- \* The unique carbon-steel deck mounting flange makes shipyard installation easy and prevents damage to the sight glass, which can occur during installation of ordinary weld-in-place sight glasses.

## SPECIFICATIONS

**Marine Sight Glass  
Model SGM-1**

Weight	=	58 lbs.
Viewing Area	=	59 Sq. In.
Wiped Area	=	34.1 Sq. In.

B-610  
—AN  
UNMATCHED  
HIGH LIQUID  
LEVEL  
INDICATOR  
FOR  
RELIABLE  
PERFORMANCE  
AND  
SIMPLIFIED  
INSTALLATION**

**30 years experience  
is behind the design of the  
B-610 for tank barges,  
container vessels and tankers.**

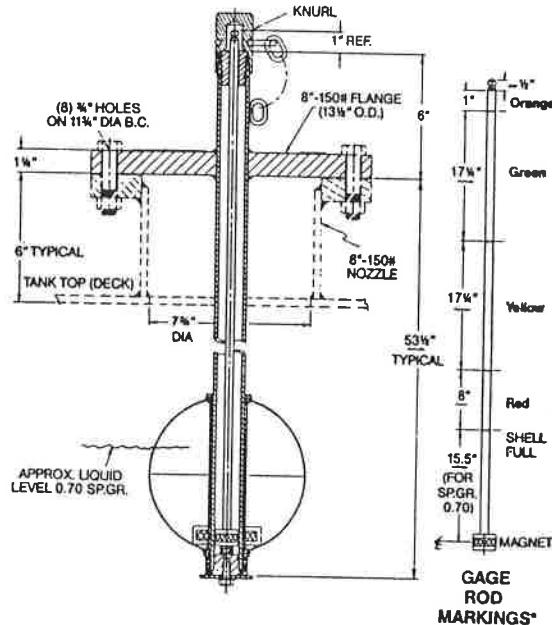

Midland's new high liquid level indicator for marine applications is a refinement of a gage design proven in the most demanding kinds of service. You can depend on it for exceptional accuracy, durability and vapor emission control—plus fast, economical installation. Complies with CFR 39.20-3(b)(1) U.S.C.G. Regulations. Approved for use on Coast Guard certificated vessels.

### MIDLAND B-610/Principles of Operation

1. A rigid teflon-covered indicator gage rod, color-coded to industry standards, incorporates a powerful magnet at its base.
2. The gage rod moves up and down inside a 1½" O.D. stainless steel tube (comparable to extra strong pipe) that is sealed to prevent product from the tank entering the tube.
3. As the product rises in the upper level of the tank, a high strength (pressure-tested to 400 psi) spherical stainless steel float moves up the outside of the sealed tube. Recessed in the float is a high-intensity ring magnet. The magnetic linkage between the float and the rod causes them to move together. As the product level in the tank increases, the rod rises accordingly—and its color code alerts the tankerman to retard the loading rate and stop in time to prevent possible overfilling.
4. When loading is completed, the indicator gage rod is pushed down to rest at the bottom of the stainless steel tube; and a protective weather cover is put back in place on top of the gaging device housing.

### MIDLAND B-610/Key Design Features

- A. Exceptionally high-strength magnets avoid accidental separation of the rod and float.
- B. The float and rod are magnetically linked as soon as the float begins to rise. Consequently, there is no need for the tankerman to engage the rod.
- C. 300 series stainless steel wetted parts assure complete corrosion resistance to most types of commodities.
- D. Heavy-duty float and gage tube will withstand forces generated by surges, impact or Butterworth cleaning operations.
- E. The extra-large 7½" diameter float remains buoyant in all services—even down to .51 specific gravity (e.g. propane).
- F. Our standard mounting is an 8"-150# ANSI (or ASA) heavy-duty steel flange. Alternative mountings and sizes are available.
- G. In addition, a companion 8" nozzle can be supplied. This is designed to be welded to the tank from the outside, eliminating any need for internal welding and scaffolding.
- H. The protective stainless steel weather cover can be removed by hand. The cover is chained to the housing to prevent misplacement.
- I. The gage rod, when equipped with additional magnets, can activate audible and visible signals, as well as system shutdown when used in conjunction with Midland B-594 or B-596 sensors. (U.S. Patent No. 4,924,703)

\*Note: Typical markings are shown. Other markings are available upon request.

## Model B-595

TANK HIGH LEVEL AND OVERFILL SENSOR

Intrinsically safe dual level alarm sensors provide independent HIGH LEVEL alarm and tank OVERFILL alarm signals to Barge Inlet connector. An 8" 150# ANSI mounting flange with integral float guide tube allows single point access for both HIGH LEVEL and OVERFILL alarm sensors. A stainless steel manual lifting handle sequentially checks float travel freedom and alarm function for each float. Approved for use on Coast Guard certificated vessels.

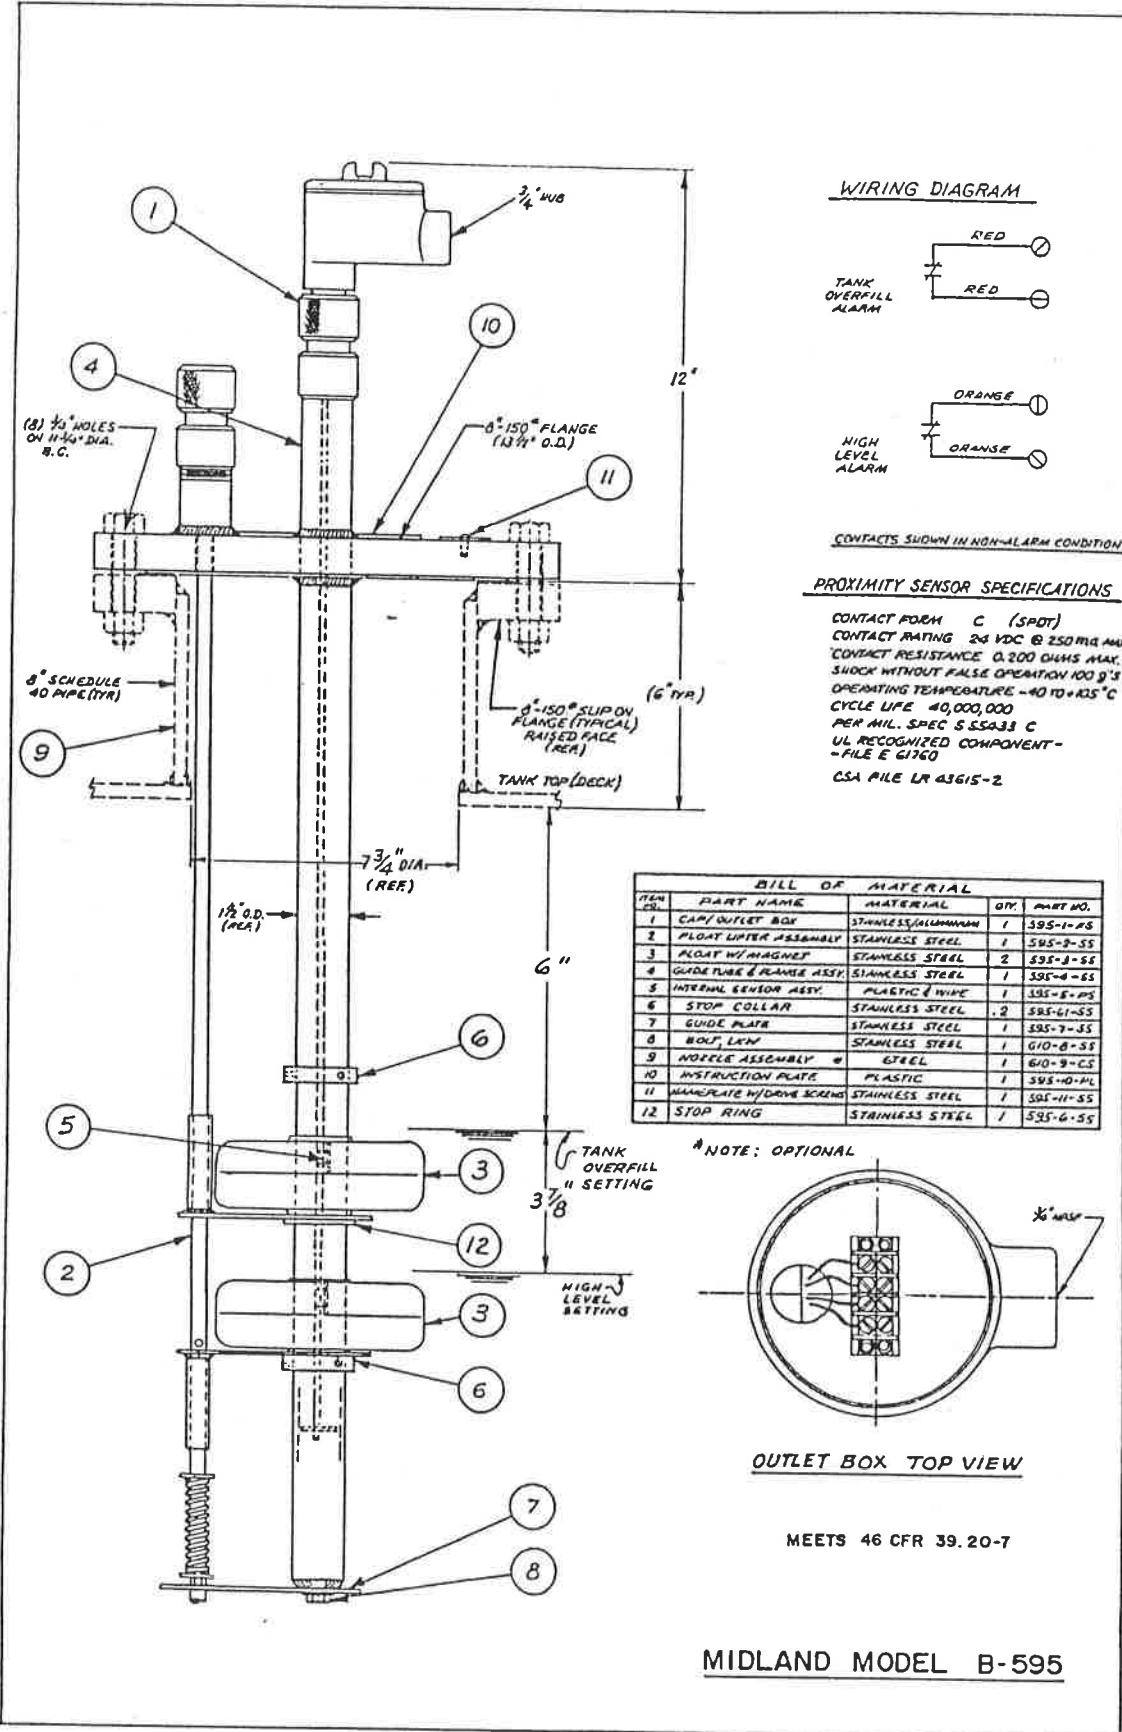

### SPECIFICATIONS:

**Operation:** Each alarm sensor is activated independently by a dedicated float.

**Sensor:**  
 Form C Contact (SPDT)  
 Contact Rating - 24 Vdc @ 250 mA max  
 Contact Resistance - 0.200 ohms max  
 Shock without False Operation - 100 g's  
 Operating Temperature - 40 to +105 °C  
 Cycle Life - 40,000,000  
 Sensor meets Mil Spec S 554433C

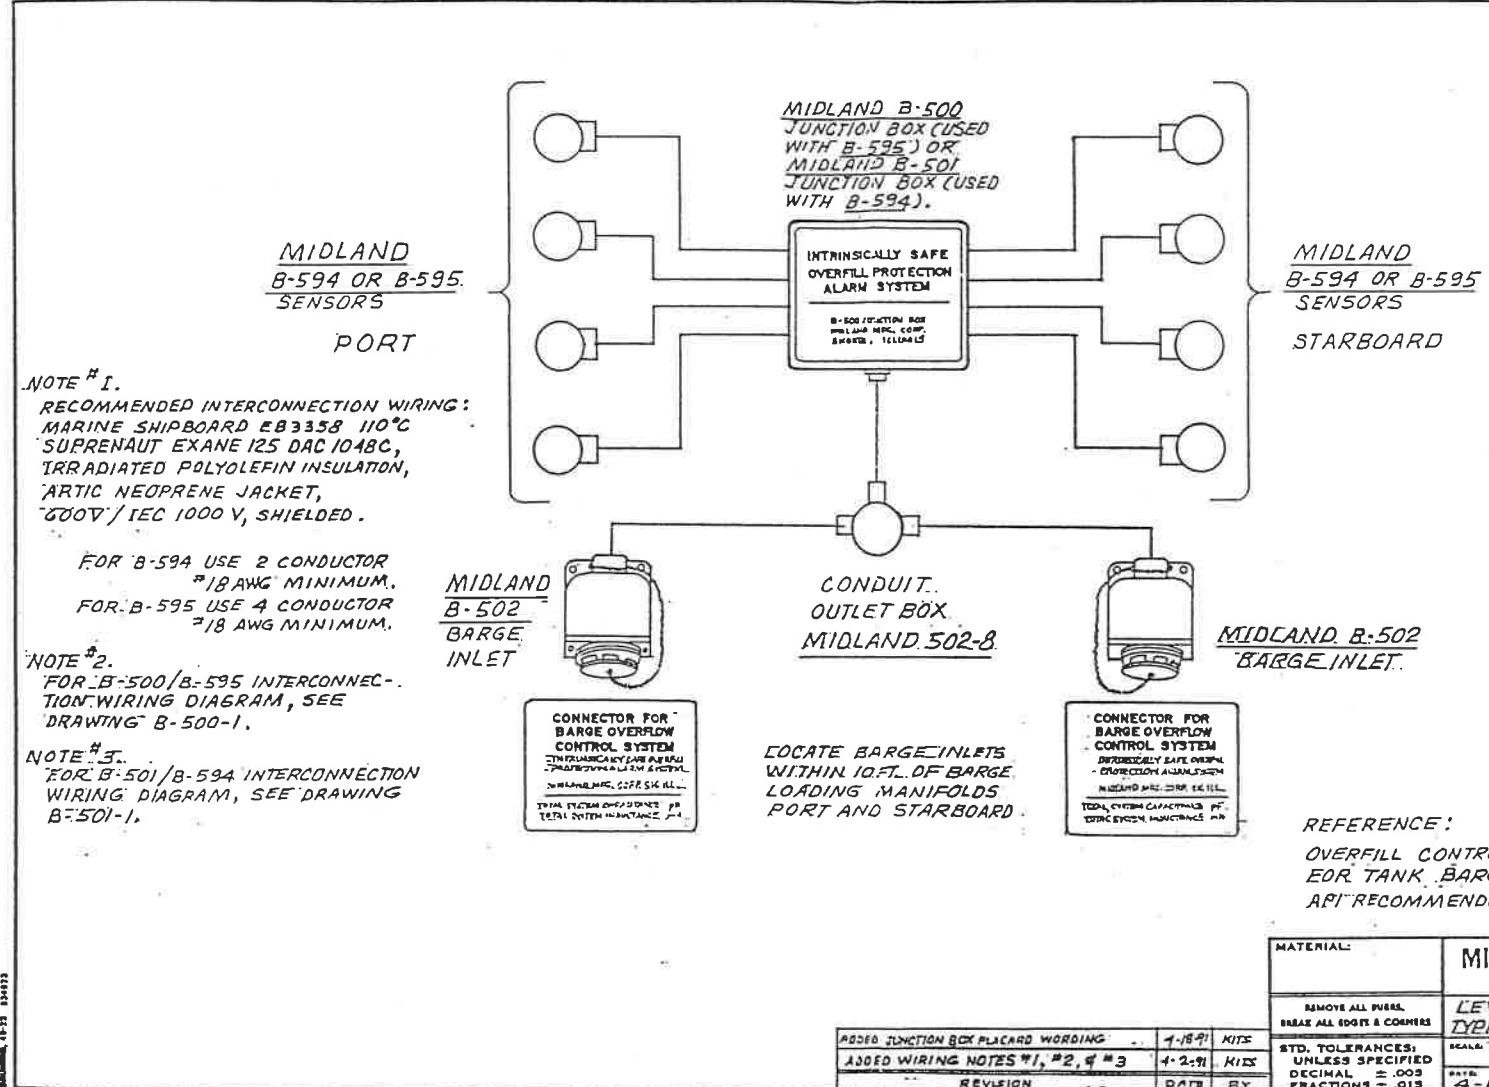

**Materials of Construction:** All stainless steel wetted parts, including mounting flange with Explosion Proof watertight conduit.

MARINE EQUIPMENT

10" SPILL VALVES

A-7103

C-2-b

## NOTES:

- 1) THESE CURVES ARE FOR VALVES MOUNTED ON HORIZONTAL FLANGES WITHIN 3" OF TANK TOP ON A WELL ROUNDED ENTRANCE
- 2) THESE CURVES ARE BASED ON 1990 TESTS BY AN INDEPENDENT LABORATORY
- 3) TO DETERMINE PRESSURE, ENTER HORIZONTAL AXIS AT DESIRED FLOW RATE, MOVE UP TO CURVE, TURN AND MOVE TO LEFT VERTICAL AXIS TO READ PRESSURE
- 4) TO DETERMINE FLOW RATE AT A TANK PRESSURE, ENTER VERTICAL AXIS AT DESIRED PRESSURE, MOVE HORIZONTALLY TO CURVE, TURN DOWN TO READ FLOW RATE

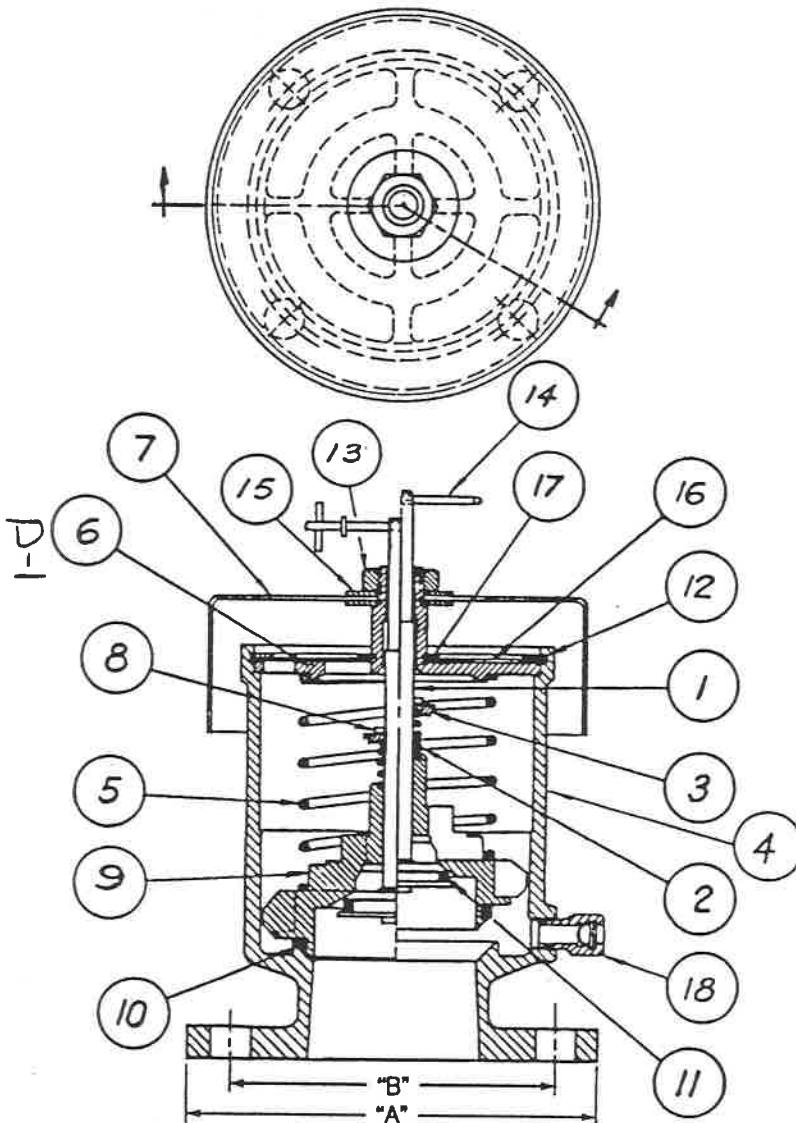

CERTIFIED AS COMPLYING WITH  
ASTM F1271-90 SPECIFICATION

FOR TRANSFER RATE VS PRESSURE DROP

OTES:

a. 46 CFR 39.30.1 (b) REQUIRES THAT, FOR GASOLINE, CRUDE OIL, AND BENZENE, PRESSURE DROP THROUGH THE VAPOR COLLECTION SYSTEM FROM THE MOST REMOTE CARGO TANK TO THE VESSEL VAPOR CONNECTION MUST BE DETERMINED BASED ON A 50 PERCENT CARGO VAPOR AND AIR MIXTURE. PER DALTON'S LAW OF PARTIAL PRESSURES, AND ASSUMING THE MIXTURE IS 50/50 BY VOLUME, THE SPECIFIC GRAVITY OF THE MIXTURE CAN BE DETERMINED AS FOLLOWS:

$$SG_{mix} = \{ (N/2) * MW_{air} \} + \{ (N/2) * MW_{cargo} \} / (N * MW_{air}) \quad \text{WHERE}$$

N = TOTAL NO. MOLECULES PER UNIT VOLUME

MW<sub>air</sub> = MOLECULAR WEIGHT OF AIR

MW<sub>cargo</sub> = MOLECULAR WEIGHT OF CARGO VAPOR

$$SG_{mix} = 0.5 * (MW_{air} + MW_{cargo}) / MW_{air}$$

A CORRESPONDING RELATIONSHIP IN TERMS OF SPECIFIC GRAVITY IS:

$$SG_{mix} = (SG_{air} + SG_{cargo}) / 2$$

FOR PRODUCTS OTHER THAN THOSE CITED ABOVE, THE SPECIFIC GRAVITY OF THE MIX CAN BE DETERMINED AS:

$$SG_{mix} = W_{v-a,115} / W_{a,115} \quad \text{WHERE}$$

$$W_{v-a,115} = VAPOR-AIR MIX WEIGHT DENSITY, & W_{a,115} = AIR WEIGHT DENSITY, BOTH AT 115 DEG F.$$

b. THE SPECIFIC WEIGHT OF THE VAPOR/AIR MIXTURE IS OBTAINED BY MULTIPLYING THE SPECIFIC GRAVITY OF THE VAPOR/AIR MIXTURE BY THE WEIGHT OF AIR AS OBTAINED FROM THE FORMULA IN CRANE T.P. 410 (PAGE A-10) [I.E.,  $W_s = (M * P) / (10.72 * T)$  WHERE M IS THE MOLECULAR WEIGHT OF AIR (28.97), P IS PRESSURE IN PSIA (SEE BELOW), AND T IS ABSOLUTE TEMPERATURE IN RANKINE (F + 460) WITH T = 115 DEGREES FAHRENHEIT PER USCG GUIDANCE.

IF  $(P_1 - P_2)/P_1 < 10\%$  THE ASSUMPTION THAT  $W_s = W_{s1} = W_{s2}$  (WITH  $W_{s2}$  EVALUATED @ P<sub>2</sub>) CAN BE CONSIDERED TO BE APPROPRIATE; OTHERWISE, A SECOND ITERATION SHOULD BE PERFORMED USING

$$W_s = W_{sav} = (W_{s1} + W_{s2}) / 2 \quad (\text{WITH } W_{s1} \text{ EVALUATED @ } P_1 \text{ AND } W_{s2} @ P_2).$$

c. THE PRECISE VISCOSITY OF THE CARGO VAPOR-AIR MIXTURE IS NOT KNOWN; HOWEVER, THE VISCOSITY OF AIR @ 100 DEGREES F IS 0.019 CENTIPOISE (SEE CRANE T.P. 410 (PAGE A-5)).

FOR PURPOSES OF THESE CALCULATIONS, ASSUMPTION THAT THE VISCOSITY OF THE CARGO-AIR MIXTURE IS THAT OF AIR AT 100 DEGREES F IS CONSIDERED REASONABLE.

FOR REFERENCE AND COMPARISON, REPRESENTATIVE VALUES OF ABSOLUTE (DYNAMIC) VISCOSITY OF VARIOUS HYDROCARBON VAPOR AND NATURAL GASES MAY BE FOUND IN CRANE T.P. 410 (PAGE A-5).

"LENGTH" IS THE DISTANCE BETWEEN THE MOST REMOTE CARGO TANK VAPOR INLET AND THE VESSEL'S VAPOR CONNECTION, AND IS ESTIMATED CONSERVATIVELY HIGH.

# GRAPH(S) FOR VAPOR GROWTH RATE (VGR) OF 100%

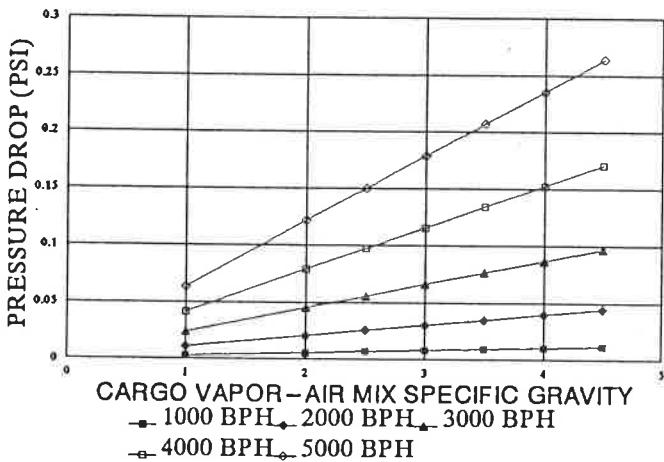

1.0 PSIG SHORE CONNECTION PRESSURE

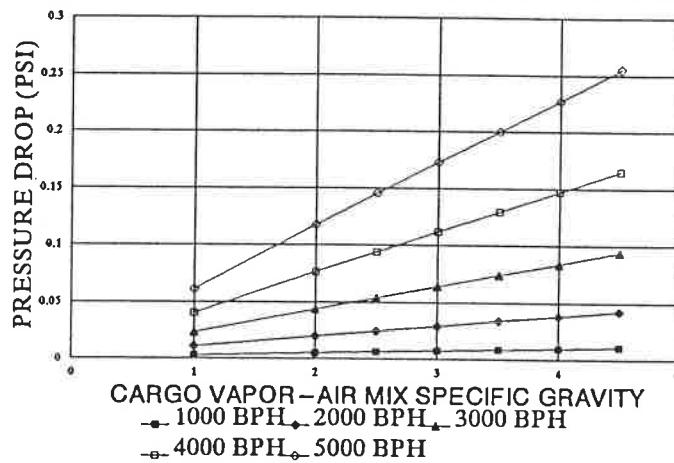

0.5 PSIG SHORE CONNECTION PRESSURE

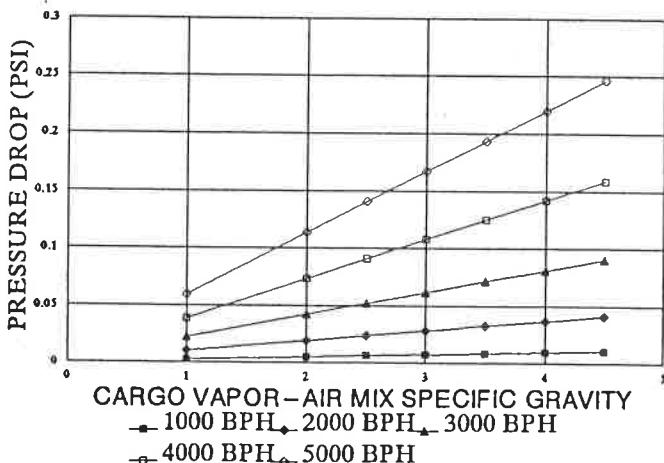

0.0 PSIG SHORE CONNECTION PRESSURE

-0.5 PSIG SHORE CONNECTION PRESSURE

-1.0 PSIG SHORE CONNECTION PRESSURE

DIRECTIONS: FOR THE CARGO TO BE TRANSFER'D:

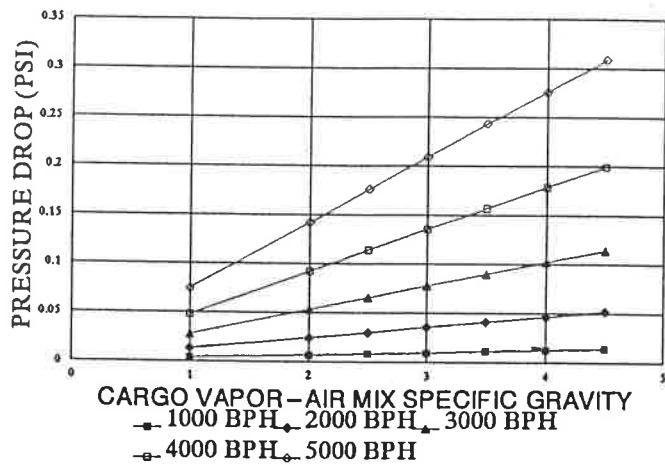

1. OBTAIN: (a) VAP.-AIR MIX GROWTH RATE (VGR), (b) VAP.-AIR MIX SPECIFIC GRAVITY, (c) MAX LIQUID TRANSFER RATE (MLTR), & (d) PRESSURE TO BE MAINTAINED @ THE SHORE CONNECTION.
2. SELECT THE GRAPH PAGE THAT APPLIES TO THE LESSER OF THE SAME OR NEXT HIGHER "VGR".
3. FROM THAT PAGE, SELECT THE GRAPH THAT APPLIES TO THE NEXT HIGHER "SHORE CONNECTION PRESSURE".
4. ENTER THAT GRAPH WITH "SPECIFIC GRAVITY" & "MAX LIQUID TRANSFER RATE" TO DETERMINE "PRESSURE DROP" FROM THE MOST REMOTE CARGO TANK TO THE SHORE CONNEC'N.
5. IF THE SUM OF "PRESS. DROP" + "SHORE CONNEC'N PRESSURE" IS LESS THAN 80% OF THE P/V SETTING, THEN THE "MLTR" IS OK.

A. FLOW RATES SHOWN HEREON (I.E., "BPH") ARE LIQUID TRANSFER RATES.

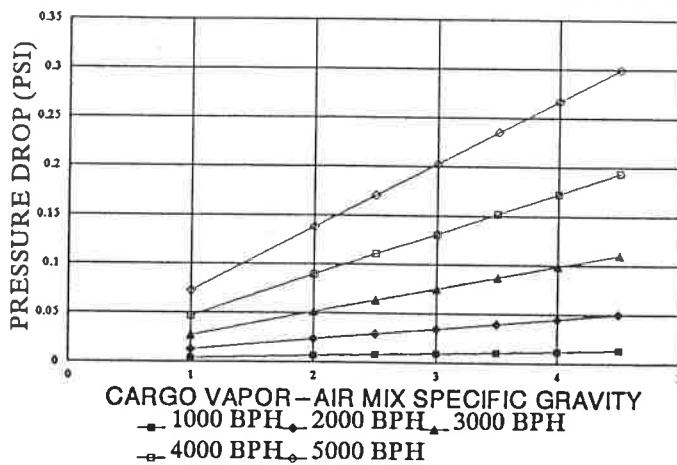

B. PRESSURE DROP IS FOR CARGO VAPOR-AIR MIX FLOW RATE OF "VGR" TIMES THE LIQUID TRANSFER RATE, AND IS FROM MOST REMOTE TANK TO SHORE CONNECTION.

0.5 PSIG SHORE CONNECTION PRESSURE

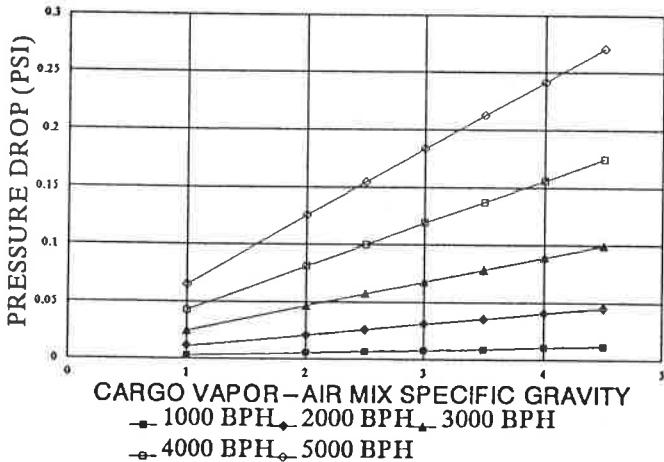

0.0 PSIG SHORE CONNECTION PRESSURE

-0.5 PSIG SHORE CONNECTION PRESSURE

-1.0 PSIG SHORE CONNECTION PRESSURE

## DIRECTIONS: FOR THE CARGO TO BE TRANSFER'D:

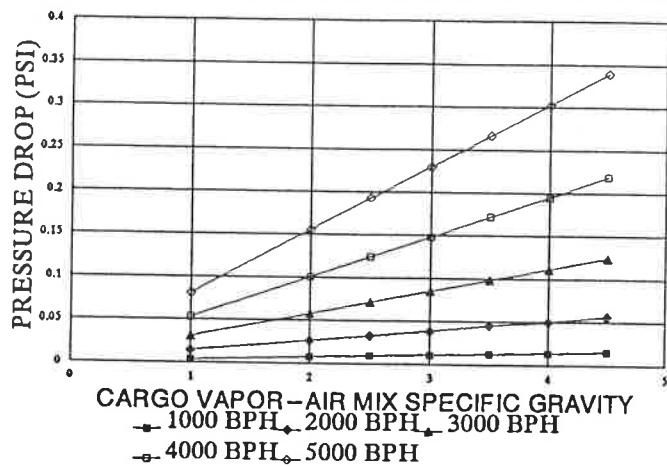

1. OBTAIN: (a) VAP.-AIR MIX GROWTH RATE (VGR),  
(b) VAP.-AIR MIX SPECIFIC GRAVITY, (c) MAX  
LIQUID TRANSFER RATE (MLTR), & (d) PRESSURE  
TO BE MAINTAINED @ THE SHORE CONNECTION.
2. SELECT THE GRAPH PAGE THAT APPLIES TO THE  
LESSER OF THE SAME OR NEXT HIGHER "VGR".
3. FROM THAT PAGE, SELECT THE GRAPH THAT  
APPLIES TO THE NEXT HIGHER "SHORE  
CONNECTION PRESSURE".
4. ENTER THAT GRAPH WITH "SPECIFIC GRAVITY" &  
"MAX LIQUID TRANSFER RATE" TO DETERMINE  
"PRESSURE DROP" FROM THE MOST REMOTE  
CARGO TANK TO THE SHORE CONNEC'N.
5. IF THE SUM OF "PRESS. DROP" + "SHORE  
CONNEC'N PRESSURE" IS LESS THAN 80% OF  
THE P/V SETTING, THEN THE "MLTR" IS OK.

A. FLOW RATES SHOWN HEREON (I.E., "BPH") ARE LIQUID TRANSFER RATES.

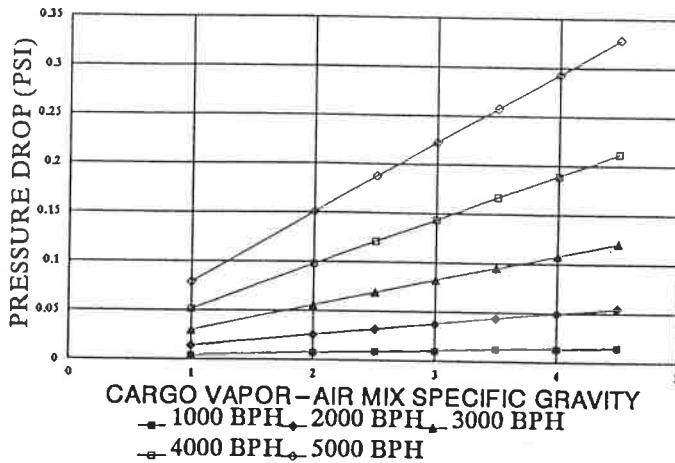

B. PRESSURE DROP IS FOR CARGO VAPOR-AIR MIX FLOW RATE OF "VGR" TIMES THE  
LIQUID TRANSFER RATE, AND IS FROM MOST REMOTE TANK TO SHORE CONNECTION.
