## French startup Kolet adds international calling to its app and advances its ambition for global connectivity

**After data, voice. Kolet introduces a feature long awaited by travelers**

**Paris, March 17, 2026** — After simplifying access to mobile internet abroad through its universal eSIM, French startup Kolet is enhancing its application with a new international calling feature. Users can now make international calls directly from the app, relying solely on an internet connection.

With this new building block, Kolet is taking a further step in its strategy to develop a comprehensive international connectivity solution covering both data and voice, without roaming charges or unexpected costs.

### **Making international calls without roaming or unpredictable bills**

Despite the widespread adoption of instant messaging services, voice remains essential in many situations: contacting a hotel, reaching a local service provider, calling a bank, or speaking with customer service while abroad. Yet international calls are still often associated with unpredictable costs and legacy roaming models. The gradual disappearance of historic services such as Skype also illustrates how quickly this market is evolving.

Kolet addresses this need with a simple and transparent model: international calls are made over the internet directly from the app, without using the user's primary mobile plan and without any surprise charges.

### **Transparent pricing before every call**

Calls are available from the **Calls** tab within the Kolet app and are paid for using **Koins**, the app's internal currency (**1 Koin = 1 euro**). Before placing a call, users can instantly view:

- the destination country
- the per-minute rate
- the maximum number of minutes available based on their balance

Rates start, for example, at **€0.03 per minute** to call the United States from France. Prices are always displayed in advance depending on the destination country, helping users avoid any unexpected charges. Even before starting a call, users can immediately see the destination

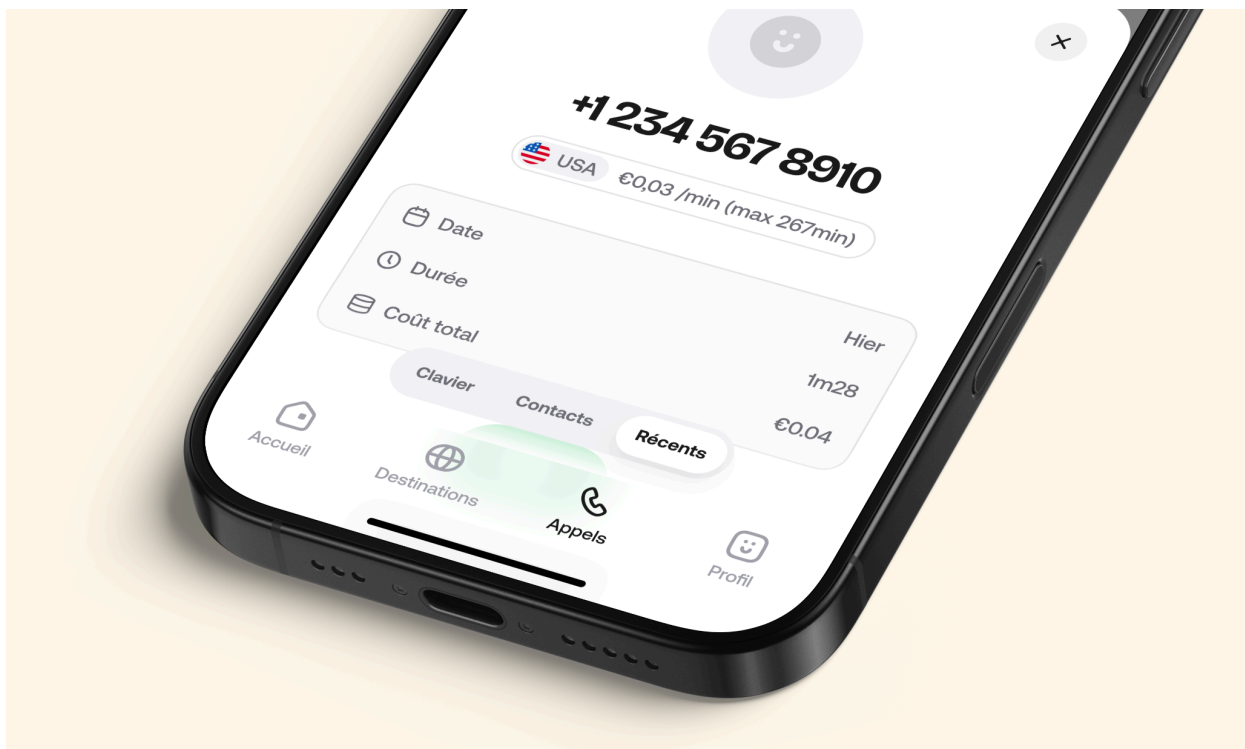

country, the per-minute rate, and the maximum number of minutes available based on their balance.

### Voice infrastructure built directly into the app

From a technological standpoint, calls rely on an internet-based telephony infrastructure integrated natively into the Kolet app, with no secondary number and no additional installation required. This allows users to remain within their usual environment while clearly separating their international communications from their main mobile line.

“Our vision is that of unified international connectivity, independent of borders and the legacy logic of telecom operators,” said **Eduardo Ronzano, CEO and co-founder of Kolet**. “After the universal eSIM for data, internet-based voice is an essential building block of this model. Ultimately, Kolet should enable users to manage all their communications from a single interface, with simple and easy-to-understand rules.”

With this launch, Kolet is strengthening its position as a technology-driven alternative to traditional roaming models and continuing its mission: to make mobile connectivity more accessible, more transparent, and fairer for users.

## About [Kolet](#)

Founded in 2024 by three entrepreneurs — **Eduardo Ronzano, Anne-Carole Cöen, and Mehdi Chraibi** — Kolet is a fully digital eSIM app that enables travelers to stay connected anywhere in the world, without a physical SIM card or hidden fees. Its B2B2C model has already attracted leading travel players including **Air France-KLM, Kiwi.com, Philippine Airlines, Exoticca, and Rail Europe**, which integrate Kolet into their customer journeys to offer instant connectivity upon arrival. Available in more than **190 countries**, Kolet includes **1GB of free data upon activation** and is part of a responsible business approach as a **certified B Corp**.
