02 | Introduction

What is Spectra Indigo Glass?

Designed with precision and backed by cutting-edge science, this package harnesses a unique biophotonic method that naturally extends the shelf life of your products up to **20% more than other containers tested.**

Every product we consume naturally ages over time, with visible light rays significantly accelerating this process. And while all wavelengths of the light spectrum will eventually contribute to decay, there is evidence that exposure to a particular amount of Ultraviolet (UV) light and Infrared (IR) light can actually extend shelf life by killing bacteria and other microorganisms on a surface, preventing spoilage.

What Do
You
Expect
From
The Sun?

Powered by nanoreflective technology, our proprietary manufacturing process layers nano-scale patterns within the optimal range of the color spectrum, enabling precise control over how light is reflected or transmitted. In doing so, our jars fully leverage the preservation power of the light spectrum. The result is a protective indigo glass barrier that blocks harmful wavelengths while embracing beneficial ones, delivering maximum preservation and performance for perishables. No other packaging on the market offers this level of protection. Backed by science and guaranteed by us. From harvest to home - freshness stays.
