JUNCTION PILES

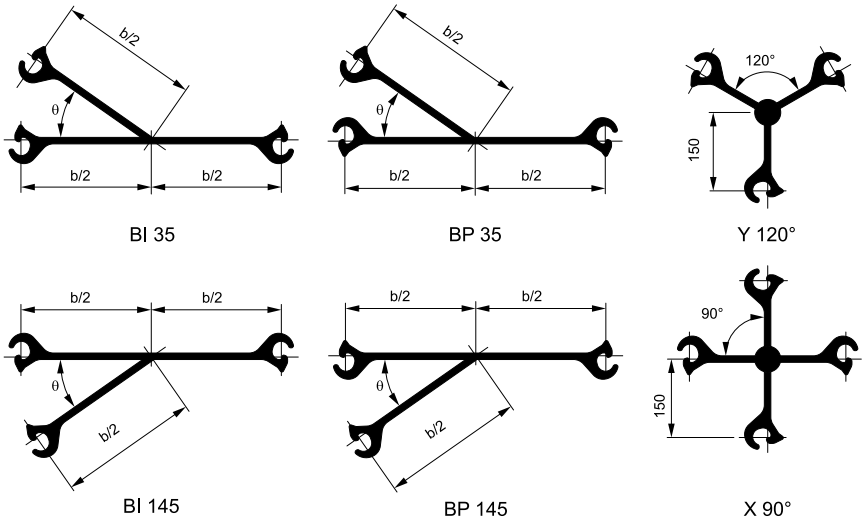

Fig. 2.2.: Characteristics of junction piles.

Connection angles Θ in the range from 30° to 45° are recommended.

It is nevertheless possible to have angles up to 90°.

BENT PILES

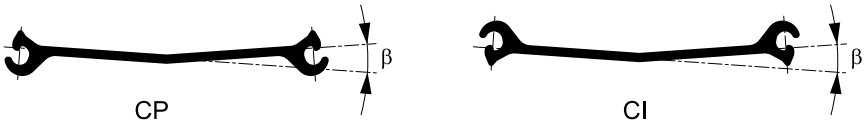

Fig. 2.3.: Bend angel β of AS 500 piles.

If deviation angles δ exceeding the values given in Table 2.1. are required, piles prebent in the mill may be used.

The maximum possible pile bend angle β is about 12°.

DELIVERY CONDITIONS

Interlock resistance

The following characteristic interlock resistance can be guaranteed:

SECTION	$R_{k,s}$ [kN/m][1)]	kips/in
AS 500 – 9.5	3500	20
AS 500 – 11.0	4000	23

[1)] For the related steel grade and further information, please contact JD Fields & Company.

For verification of the piles both, yielding of the web and failure of the interlock, should be checked.

The test procedure is based on Annex C of EN10248-1 (2023).

SELINE® SEALANT

Seline®

The watertightness of a sheet pile wall essentially depends on the number of interlocks and the interlock geometry. Despite the relatively compact nature of the Larssen interlock, which is a feature of all hot-rolled sheet piles from ArcelorMittal, additional interlock sealants are often used to further reduce water penetration.

SELINE® | PRODUCT FEATURES

Seline® is a completely newly-developed, environmentally friendly sealant for sheet piles from ArcelorMittal. Unlike all other existing sealants, Seline® contains a renewable raw material: balsam resin (also known as colophony or gum rosin). This resin is a natural raw material that was used by the ancient Romans and Egyptians. The tree resin is mainly obtained from pine trees by scratching the tree and collecting the balsam that drips out.

Seline® is heated in a similar way to bitumen-based sealants and then filled into the sheet pile interlocks. After briefly cooling down, Seline® provides an extremely reliable water seal for sheet pile walls.

Seline® is ideally suited for temporary and permanent sheet pile wall structures.

SELINE® | SEALING PERFORMANCE

Before a new sealing product can be launched on the market, its performance must be evaluated in several tests. ArcelorMittal is the only sheet piling supplier that has implemented a realistic testing procedure to ensure the performance of its products under real-life conditions.

Once the laboratory tests had been completed and validated, the most important step to be followed was installation on site, followed by a direct watertightness test.

For this purpose, the sealed sheet piles were driven into a hard clay soil at the test site in Mittersheim, France, and the watertightness tests were carried out under the supervision of the independent testing institute DNV/GL.

The results showed that, after 24 hours under 100 kPa (1 bar), 24 hours under 200 kPa (2 bar) and again 24 hours under 300 kPa (3 bar) water pressure, Seline® improved the performance compared to the well-established sealants.

These results were verified by DNV/GL and thus provide reliable characteristic values for this newly developed product.

Further tests are planned for 2025. The aim is to examine the behaviour of Seline® in other soil types and different pile-driving methods in more detail.

The average inverse joint resistance ρm was determined according to EN 12063, see table below:

	ρ_m (10-10 m/s) at a water pressure of	
	100 kPa	200 kPa
Seline®	< 600	< 700

SELINE® SEALANT

SELINE® | ENVIRONMENTAL COMPATIBILITY

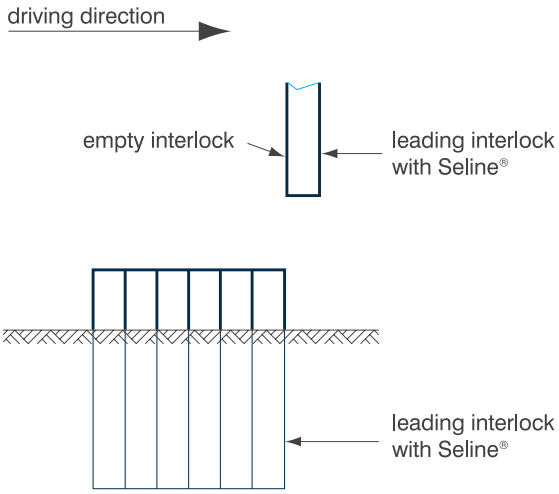
Seline® is a natural product and does not contain any substances that have to be listed in accordance with Regulation (EC) No. 1907/2006 (REACH).

Like all ArcelorMittal sealing systems/materials, Seline® has also been tested by the Hygiene Institute of the Ruhr. The "Ecotoxicological Test" showed that Seline® has no relevant ecotoxicological impact potential on the soil and existing groundwater and that from a water hygiene point of view there would be no negative impact on the living environment due to soluble ingredients. Consequently, the HY Institute came to the conclusion that the use can be assessed as ecotoxilogically harmless.

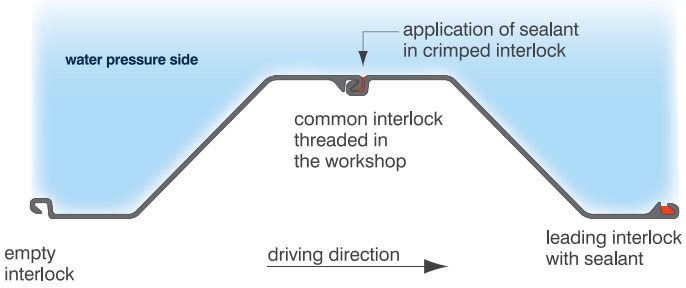
SELINE® | INSTALLATION RECOMMENDATION

The filling of the interlocks with Seline® in the factory takes place under consideration of the following aspects:

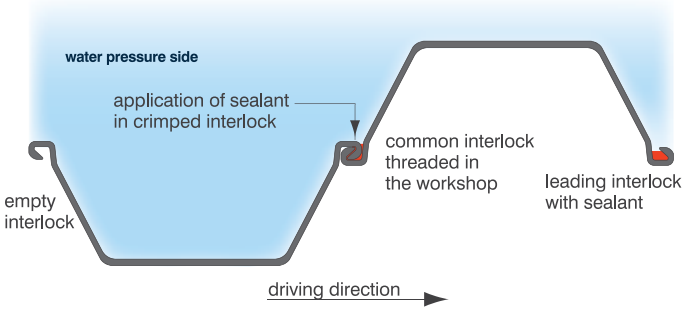
Interlocks must be clean and dry; the sheet piles must be laid out in a perfectly horizontal position. To prevent the hot product from flowing out, the interlock ends must be sealed with putty.



Detail of application in Z-piles



Detail of application in U-piles



SELINE® | SEALING PERFORMANCE

Seline® is heated to processing temperature; stirring ensures the homogeneity of the material; Seline® is then poured into the interlocks using a suitable pouring device.

The driving direction and the position in relation to the water pressure must be observed: The filled interlock must be installed on the side of the water.

If the piles are supplied as single piles, one free interlock per pile is filled. For double piles the crimped middle interlock and one free interlock are filled.

Seline® is suitable for all sheet pile driving methods (impact, vibration and pressing). The outside temperature should not be below 0°C.

AKILA® SEALING SYSTEM

PRODUCT PROPERTIES

AKILA® is a well-proven environmentally friendly high performance sealing system for ArcelorMittal sheet piles. The system is based on three compression "lips" - consisting of a product called MSP-1 - mechanically extruded into the free interlocks of single or double piles. In the case of double piles, the intermediary (paired) interlock is sealed with a second product MSP-2.

MSP-1 and MSP-2 both belong to the family of silane modified polymers (also called MS-Polymers), and are single component elastic sealants with a density of 1.41 g/cm^3 and 1.48 g/cm^{3,} respectively. They are UV-stable and have an excellent adhesion to primerless steel. Both products are resistant to humidity, weathering and temperatures between -40°C and+90°C (even up to 120°C for short periods). They have an elongation at break of at least 380%, a Shore A hardness after complete polymerization of 58 for MSP-1 and 44 (after 14 days) for MSP-2, and are durable in contact with freshwater, seawater, as well as various hydrocarbons, bases and acids (depending on concentration, a complete list is available upon request).

WATERTIGHTNESS PERFORMANCE

A series of in situ tests were carried out in stiff clays near Mittersheim (FR) and in soft sandy soil near Zeebrugge (BE), in order to determine the inverse joint resistance factor or value ρ_m.

Single sheet piles and crimped double sheet piles fitted out with the AKILA® system were driven into the ground using an impact hammer as well as a vibratory hammer. After installation, watertightness was tested at water pressures of 2 and 3 bar, according to a procedure developed by Deltares and ArcelorMittal. The average inverse joint resistance values p_m were determined according to EN 12063.

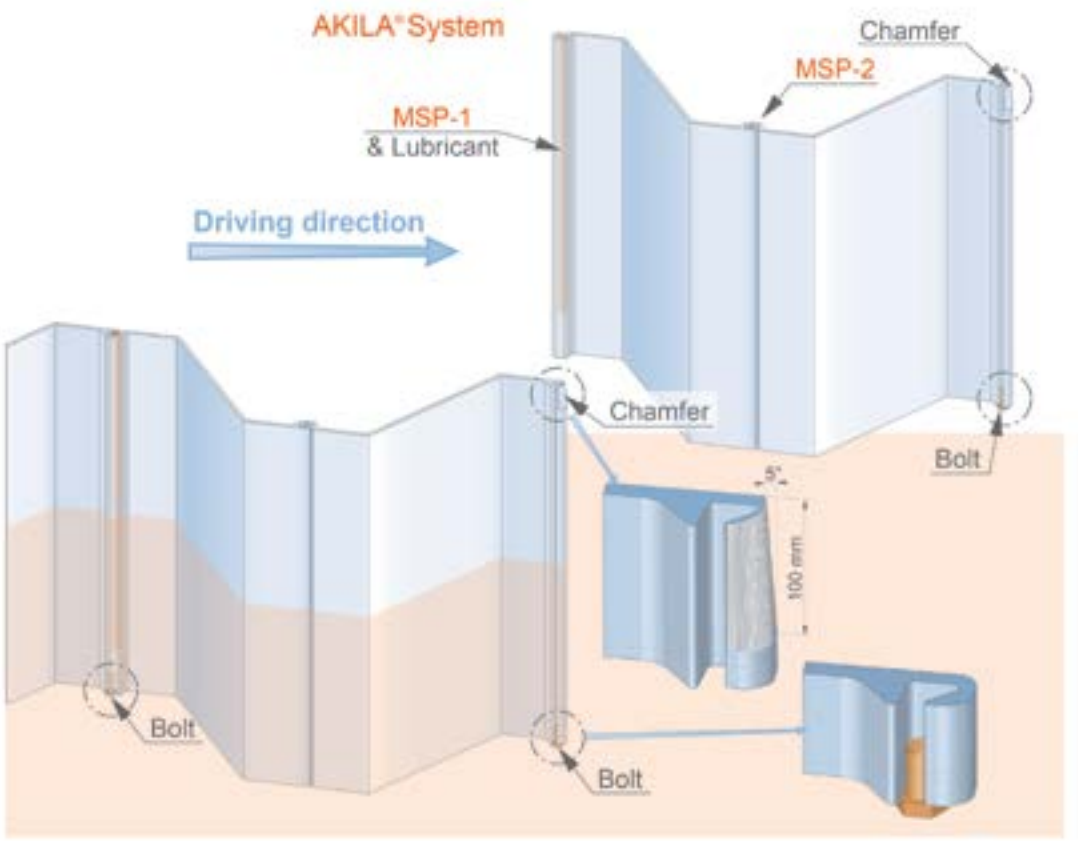
Testing and results were witnessed and certified by an independent third party (Germanischer Lloyd). The results for single and double piles are listed below.

	p_m (m/s) for water pressure of	
	2 bar	3 bar
Single Piles (MSP-1)	$4.9 \cdot 10^{-11}$	$8.6 \cdot 10^{-11}$
Single Piles (MSP-2)	$3.3 \cdot 10^{-11}$	$4.7 \cdot 10^{-11}$

ENVIRONMENTAL CERTIFICATION

MS-Polymers are considered environmentally friendly as they are solvent free and - unlike polyurethanes - do not contain isocyanates.

AKILA® is certified by the "Hygiene-Institut des Ruhrgebiets" as suitable for use in contact with groundwater.



Installation recommendations (driving direction, chamfer, etc.)

DRIVING RECOMMENDATIONS

The above mentioned inverse joint resistance ρ_m values for the AKILA® system were determined through driving tests using the impact hammer and vibratory hammer. In the latter case, the driving speed must be faster than 3 m per minute. We recommend prior consultation of ArcelorMittal's technical department in case the press-in method is used.

An environmentally friendly lubricant must be applied to the sealant in the interlocks prior to driving.

During driving, the "empty" interlock must be the leading interlock (see sketch). The leading interlocks are chamfered on the top, and the filling of the free interlock with soil during driving can be prevented by fixing a bolt to the bottom of the interlock (or similar solution). Ambient temperature during installation must be above 0°C.

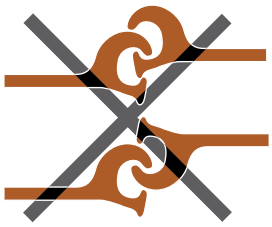
Proper Interlock



Improper Interlock

Grade	Minimum Interlock Strength(1)	Minimum Swing(2)
A328	16 kips/in. (2,800 kN/m)	10 degrees
A572-50	20 kips/in. (3,500 kN/m)	10 degrees
A572-60	24 kips/in. (4,200 kN/m)	10 degrees

Higher interlock strengths are available; obtainable swing may be reduced in interlock strengths above 24 kips/in (4,200 kN/m).

(1) These minimum ultimate interlock strengths assume proper interlocking of sheets. To verify the strength of PS Sheet Piling, consider both yielding of the web and failure of the interlock.

(2) Swing reduces 1.5 degrees for each 10 feet (3 meters) in length over 70 feet (21 meters).

As a general rule, Gerdau advises against interlocking PS sections with other producers' section(s).

Gerdau PS 27.5 and PS 31 can be interlocked together. PS and Z-Piling sections should not be interlocked together.

Small cells constructed with bent web piles must have half of the piles bent with the fingers inside and half with the fingers outside.

PS 27.5 and PS 31 when properly swing up to 10 degrees (in either direction) for lengths up to 70 feet (21 meters). The ability to obtain a full 10 degrees swing decreases with length because of the difficulty in handling the longer pieces. For lengths over 70 feet (21 meters), it is necessary to anticipate a reduction in obtainable swing of 1.5 degrees for each 10 feet (3 meters) increase in length.

SETTING AND DRIVING TIPS FOR PS FLAT SHEETS:

Although setting and driving techniques vary with the individual contractor and site conditions, several basic principles can generally be applied. It should be realized that the lack of good setting and driving practice can result in job delays and an unsatisfactory structure. The following suggestions are offered to help avoid problems at the site:

Handling of PS sections: These sections have very little modulus (beam strength) and are, therefore, very susceptible to handling damage. It is important that great care be taken when transporting or lifting these sections. When sheets exceed 70 feet (21 meters) in length, they should be lifted at two or more points.

Have an adequate steel template: Longer sheeting lengths will require a two or three tier template with tiers spaced 15 feet (4.5 meters) or more apart. For example, a contractor should consider at least a two-tier template when installing 70 foot (21 meters) or longer sheets as this will facilitate setting and driving and result in a superior product. As with Z-Piling, it is important that each sheet be plumbed and secured when set.

The diameter of the template is predicated on the contractor's experience and method of setting circular cells. It is important that the template diameter be less than the theoretical inside clear cell diameter to easily close the cell. Wood blocking may be utilized to adjust the template to ensure the proper setting width. Upon filling, the finished cell will expand to meet or exceed published values. When a cell with long lengths is being constructed, it may be advisable to stiffen the starter sheet by reinforcing it full length with a structural shape.

Site conditions such as swift water or hard driving may require more sheets to be reinforced.

Splicing: When it is necessary to splice PS sections, the splice point on adjacent sheets should be staggered by several feet.

Mark the driving template for each pile or pair of piles: This allows for wall adjustments to be made during the setting phase, ensuring that the sheets are located properly for cell closure.

Ensure that the sheets are properly interlocked when set: Improper interlocks become the "weak links" and result in job delays and/or failures. A closed cell must have an even number of sections (including connectors) to avoid an improper interlock. Set all sheets in the cell before driving any of the sheets, other than nominal pinning of the starter sheet(s).

"Shake out" several sheets at any closure point: Following good practice as noted above should ideally result in the last sheet sliding smoothly down into the remaining gap. Although the first sheet is set plumb and the next to last sheet is plumb, the chances that the remaining gap is uniform (19.69 inches or 500 mm) the full length is improbable. Picking up and dropping, or "shaking out," several sheets near the closure point until the sheets run smoothly will minimize the chance of driving sheets out of interlock.

Drive piles in pairs: Once sheet piles are threaded and set, it is more economical to drive two at a time. Some experts suggest that the energy needed to drive a pair may be only 50% more than that required to drive a single pile.

Drive piles in stages and work around the entire cell by alternating sheets (pairs): This allows the piles to be guided by those previously driven and lessens the chance of driving sheets out of interlock. The distance a pile, or pair of piles, should be driven at any one time will be governed by the driving conditions. In the first pass around the cell, every other pair is driven perhaps 4 feet (1.2 meters). In the second pass around the cell, the un-driven pairs are driven 8 feet (2.4 meters), 4 feet (1.2 meters) restrained by the adjacent pairs and then 4 feet (1.2 meters) into virgin soil. This procedure is continued until the cell is driven to design tip elevation. A good practice to keep the cell plumb is to reverse the direction of driving for each pass around the cell.

SHEET PILE DRIVE POINTS

We make a “universal” tip to fit all piles, as well as a wide selection of tips made to fit each of the most popular sheet piles used.

WELD PROCEDURE

These points should be welded with a 5/16” fillet along the entire length of the top flange on both sides using 70xx series rod.

FEATURES

- Universal Straight Bar
- Other types can be made

Sheet pile shoes are only available for PZC 13 & 18. All other sizes require bar stock.

HANDLING HOLES

Handling holes are standard for all sheet pile sections and are located in the centerline of each section.

Y = 6” (152.4 mm)

Ø = 2.5” - 2.625” (63.5 mm - 66.7 mm)

Note: The Y location can be adjusted if needed upon request.

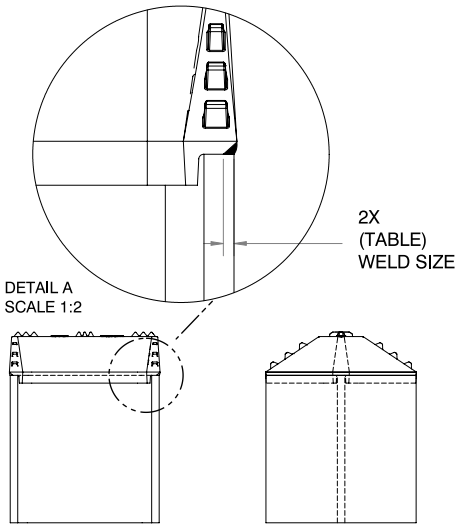
H-PILE POINTS

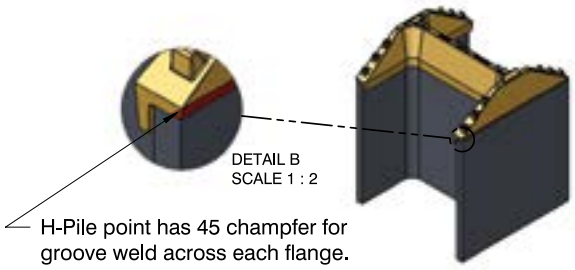
H-Pile points are made of high strength, low alloy cast steel. Cast steel is a superior material choice because it's isotropic – its properties are uniform in all directions. Cast steel points absorb impact and transfer it uniformly to the end of the pile.

Tips are pre-beveled, eliminating pile end preparation. The weld prep is already built into the point; our castings have a 45 degree weld chamfer so there is no need to chamfer piles.



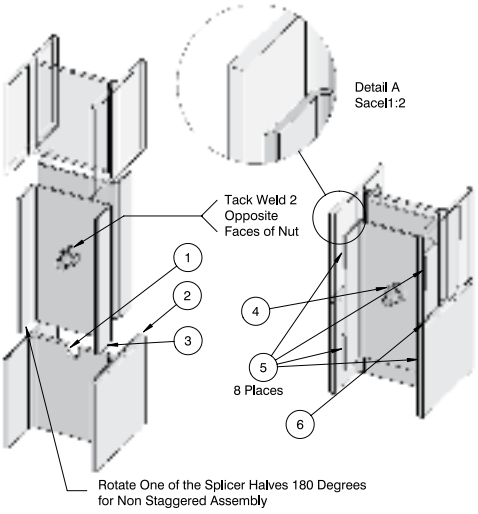
WELD PROCEDURE

1. To ensure proper seating of the tip, remove all flash from end of pile and insert tip.
2. Using a 70xx series rod, make a single pass weld across each flange on the outside only.
3. Do not weld web or inside of flanges.
4. For heavier sections, you may want to use multiple welding passes.



H-PILE SPLICER

H-Pile splicers save time during driving of long piles by eliminating the need for a full penetration weld. Made in ASTM A572 GR.50 or higher strength if requested.



WELD PROCEDURE

1. Cut 1.0" wide x 1.0" long notch in center of web of one pile.
2. Chamfer outside edges of flanges on ends of one or both piles to be spliced. Make chamfer to about 1/2 material thickness.
3. Insert splicer on first pile making sure bolt is completely inside notch.
4. Install the next section of pile and tighten bolt.
5. Using a 70xx series rod, weld the flanges of splicer to the flanges of the pile with (TABLE)" by 3" vertical fillets.
6. Weld the outside flanges of the piles to complete.

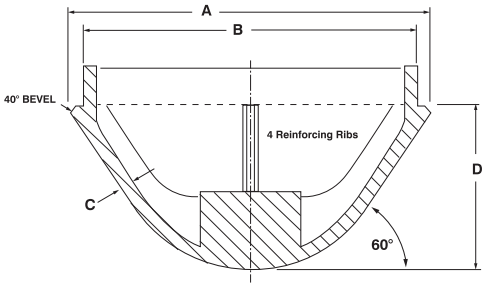
INSIDE FLANGE CONICAL POINTS

Conical Points are the preferred end closure for pipe piles. The conical shape pushes the earth aside and preserves friction. The snub nose conical is an economical design which provides end protection in most soil conditions.



SIZE:

The snub nose conical point is available for 8-5/8", 10-3/4", 12", 12-3/4", 14", 16", 18", 20", and 24" O.D. pipe.

BENEFITS:

60 degree Conical Points with heavy internal ribs aid in penetration in most soils. On boulders or uneven rock, the point helps to distribute the load around the periphery of the pipe rather than concentration it on a quadrant - as occurs with plate closure.

STEEL GRADE:

High Strength Heat-Treated Cast Steel Grade ASTM A148 80/50 - other grades also available.

INSIDE-FIT CONICAL PIPE POINTS

Inside-fit conical points are manufactured with 60 degree slope for optimum ease in penetration and even distribution of load. The conical points are slip fit and can accommodate schedule 80 and thicker wall pipe. There is an option of a blunt nose if desired.

Our conical points are easy to install with a slip-on fit. The design places the cross-sectional area directly below the wall of the pipe for maximum support during penetration. They are a more heavy-duty construction than other brands.

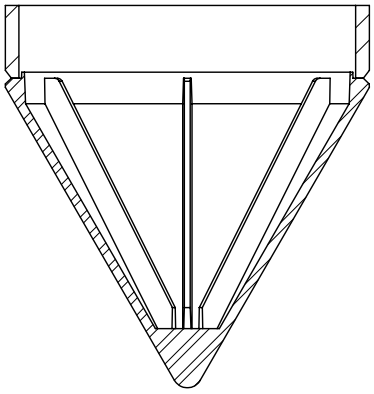
The inside-fit conical point has a weld prep built into the shoe. These tips are designed with a weld chamfer built into the casting. Slip shoe inside pipe and using a 70xx series rod weld a 5/16" or larger weld all around.

WELD PROCEDURE

Welding for most sizes requires a simple 5/16" fillet weld using 70xx series rod all around the top of the flange.

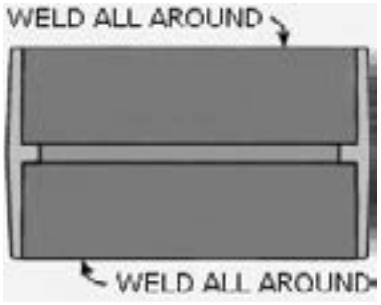
Type Inside-Fit

Conical Point and Pipe Cross-Section View



CAST STEEL PIPE SPLICERS

Cast steel splicers have the advantage of uniform sizing — there is no risk of improper fit, compared to fabricated splicers that are individually made. JDF Construction Products casts splicers in ASTM A 27, Grade 65/35, with ASTM A 148 grade 90-60 on request.



WELD PROCEDURE

Pipe splicers are drive fit. Under proper conditions, the drive fit is water tight. If welding is desired, a simple 5/16” fillet using 70xx series rod at the top and bottom is all that is required.

FEATURES

- Compression Fit
- Slip Fit

OPEN ENDED INSIDE-FIT CUTTING SHOES

Both of our cutting shoes are easy to install with a slip-on fit. The design places the cross-sectional area directly below the wall of the pipe for maximum support during penetration. They are a more heavy-duty construction than other brands. The inside-fit cutting shoe has a weld prep built into the shoe.

Inside-Fit

WELD PROCEDURE

These tips are designed with a weld chamfer built into the casting. Slip shoe inside pipe and using a 70xx series rod weld a 5/16” weld all around.

FEATURES

- Fits All Standard Pipe Sizes
- All Steel Alloy Grades

OPEN ENDED OUTSIDE-FIT CUTTING SHOES

Like our inside-fit shoe, this shoe has a slip-on fit, and the cross-sectional area lies below the wall of the pipe. The outside-fit cutting shoe has a natural fillet on top for easy welding.

Outside-Fit

WELD PROCEDURE

These slip fit shoes are easily attached with a 5/16” fillet weld at the top of the flange. For best results, weld all around the shoe with a 70xx series rod.

FEATURES

- Fits All Standard Pipe Sizes
- All Steel Alloy Grades

WELD/CHILL RINGS

We manufacture weld rings to fit all sizes of pipe and wall thicknesses. The standard weld ring is 1/8” thick.

FEATURES

- Spherical Spacers
- Short or Long Pin Spacers
- Stainless and Carbon Steel

The inside diameter of a specific nominal pipe size will vary due to the difference in pipe wall thickness. The JDF Construction Products split commercial ring is designed to compensate for these variations. When inserted into the pipe, the ring can be closed at the split or have a gap, depending on the inside diameter of the pipe. These rings are also designed and manufactured with an opening at the split which permits the welder to compress the ring when it is inserted into the pipe. When released inside the pipe opening, the ring will spring back and make contact throughout the inside circumference of the pipe. The usual procedure followed when using our JDF Construction Products split commercial rings is to insert the ring into one end of the pipe, and then bring the other pipe over the opposite end of the ring, forcing both ends of both pipes against whatever root opening spacers are furnished on that ring.

Type LG
Type LG Ring Spacers are removed in the welding process

Type S
Type S Ring Spacers may be removed or melted into the weld

Type W
Type W Ring is furnished without spacers

ULTRA-S

For Larssen sheet piles

Steel grades: S355J2, 572 Grade 50
Steel thickness: 0.35“ (9 mm)
Standard lengths: 38.7 ft (11.8 m)
Weight: 17 lbs/ft (25.3 kg/m)
ULTRA-S corner section can be driven individually up to a length of 38.7 ft (11.8 meters), provided that there are no weld joints.

LV20n

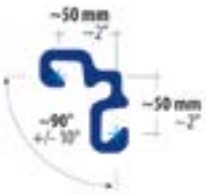
For Larssen sheet piles

Steel grades: S355J2, 572 Grade 50
Steel thickness: 0.32“ (8 mm)
Standard lengths:
38.7 ft (11.8 m), 44 ft (13.4 m)
Weight: 9.45 lbs/ft (14.07 kg/m)

LLS90

For Larssen sheet piles

Steel grades: S355J2, 572 Grade 50
Steel thickness: 0.35“ (9 mm)
Standard lengths:
26.25 ft (8 m), 38.7 ft (11.8 m)
Weight: 11.87 lbs/ft (17.66 kg/m)



LLS135

For Larssen sheet piles

Steel grades: S355J2, 572 Grade 50
Steel thickness: 0.35“ (9 mm)
Standard lengths:
26.25 ft (8 m), 38.7 ft (11.8 m)

NOTES

GEOSTRUCTURALS

TIE RODS

KEY FEATURES

Tie Rods produced from THREADBAR® are used for marine bulkheads, docking facilities, barge and ship docks as well as offshore platforms. They are a cost effective alternative to large diameter A36 Tie Rods with upset threads.

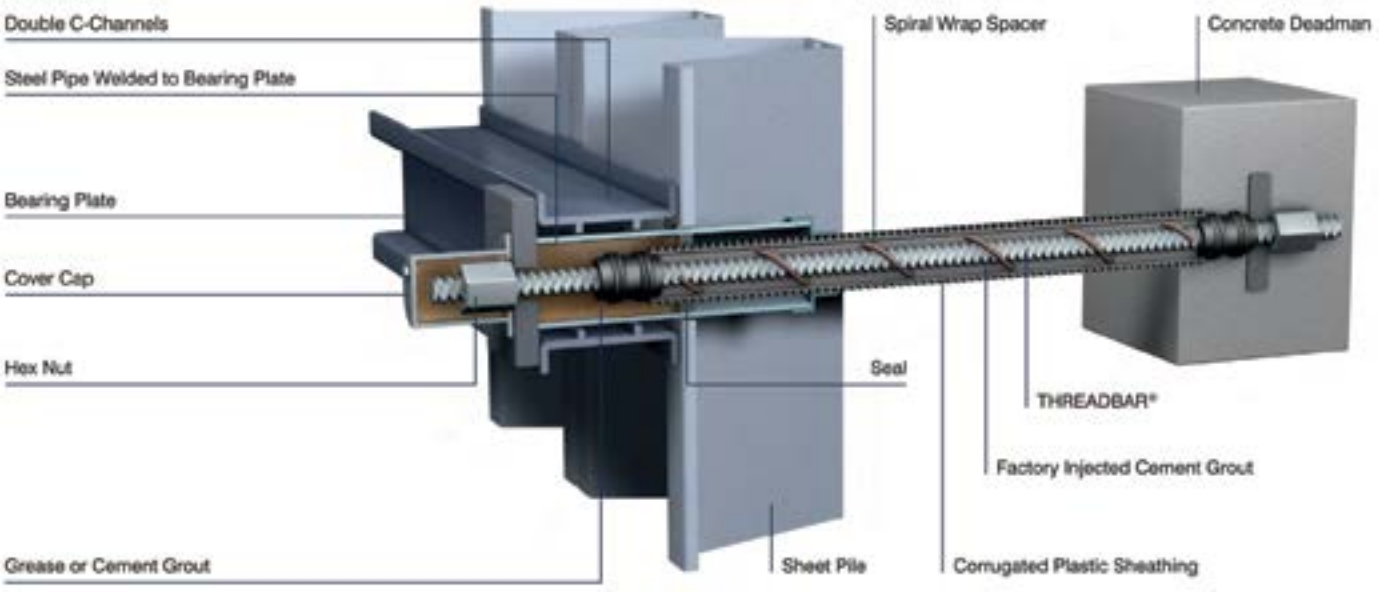
Continuous, coarse thread allows for rough site handling and for easy on site length adjustments since cutting or coupling of the rod is possible along its entire length.

CORROSION PROTECTION OPTIONS

- Double Corrosion Protection (DCP)
- Hot dip galvanizing
- Epoxy coating
- Tape coating

TIE ROD WITH DOUBLE CORROSION PROTECTION (DCP)

Recommended for permanent applications in agressive enviroments



WALER CONNECTION

Short bolts are needed to connect a standard sheet pile wall or a modular sheet pile wall to a load distributing double channel beam. This can be done with Grade 75 or Grade 80 THREADBAR®.

The required length of the bar depends on the depth of the sheet pile profile, the width of the beam, the plate thickness and the nut length.

THREADBAR® REINFORCING SYSTEMS

INTRODUCTION

THREADBAR® Reinforcing Steel is available in Grades 75, 80, 100 for sizes #6 through #20, and Grade 75 to #24 and #28. Threadbars conform to the requirements of ASTM A615, except in markings. Threadbars may be shipped to the job in mill lengths or fabricated to specifications.

THREADBAR® Reinforcing Steel has a continous rolled-in pattern of thread-like deformations along its entire length. More durable than machined threads, the deformations allow nuts couplers to thread onto a Threadbar at any point along its length.

Threadbars may be epoxy coated in accordance with ASTM A775 or galvanized in accordance to ASTM A123. Threaded accessories for coated bars thread over the coating.

ADVANTAGES OF HIGH-STRENGTH THREADBAR® REINFORCEMENT

- Fewer bars to handle
- Less congestion
- Lighter reinforcement assemblies
- Faster construction
- Easy to install coupler system
- Can replace rebar terminator with a bearing plate with top and bottom nuts

Having to hoist, handle and place a lower volume of reinforcing steel makes installation simpler and faster. And, less congestion results in higher quality concrete placement with reduced risk of consolidation issues. All these advantages result in a reduced volume of steel and shorter construction time leading to a lower overall cost of the reinforced concrete structure.

FIELDS OF APPLICATION

- Concrete reinforcement
- Micropiles
- Auger cast piles
- Caissons
- Drilled shafts

THREADBAR®
REINFORCING SYSTEMS

COUPLER SYSTEM

Couplers and hex nuts develop the full ultimate load of the Threadbar. Slippage of the coupler under stress is controlled by torquing opposing Threadbars together or by using nuts. The magnitude of the torque required varies with the allowable slip and Threadbar size.

The THREADBAR® reinforcing system offers a simple, reliable and economical splice. A splice requires less crane time and less labor time for assembly than required for other splices.

Unlike some splices, the splice may be installed in adverse weather conditiions and does not create a fire hazard. Opposing Threadbars need only to be chalk marked before assembly to assure proper engagement, supervision and quality control requirements are minimized.

COUPLER WITH HEXNUTS

When opposing threadbars are not torqued together, hex nuts will be used on each end of the coupler and tightened against the coupler.

The splice will develop the full ultimate load of the bar in tension and compression.

COUPLER WITH LOCKNUTS

Locknuts can also be used each side end of the coupler similar to hex nuts. The splice will develop the full load ultimate load of the bar in tension and about half the ultimate load in compression.

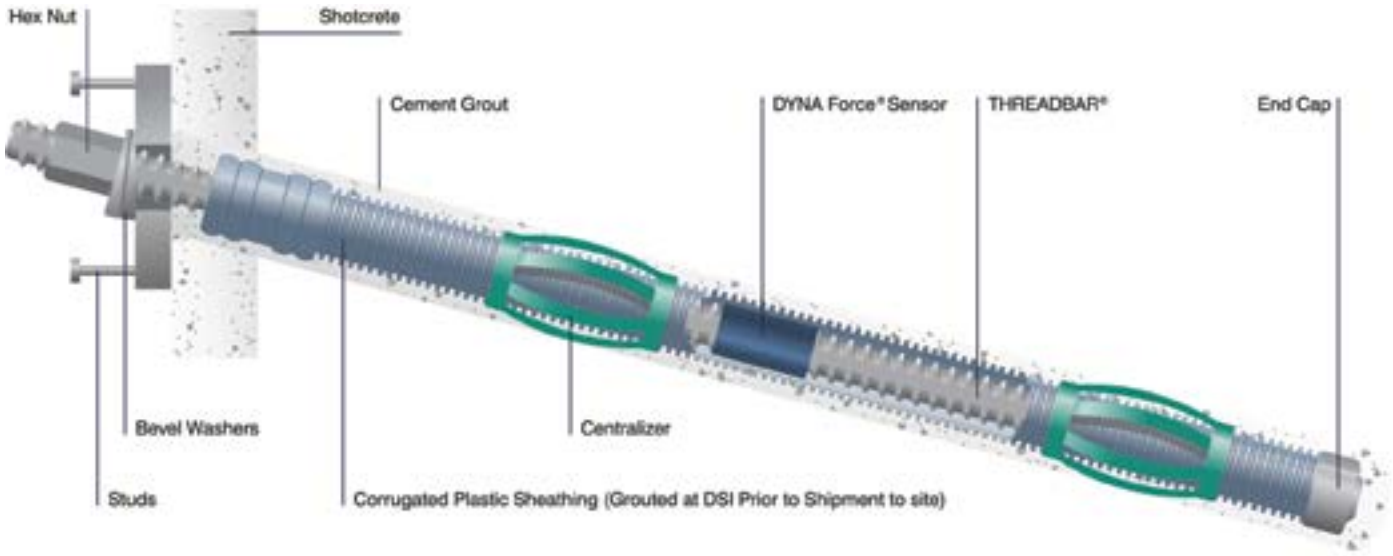
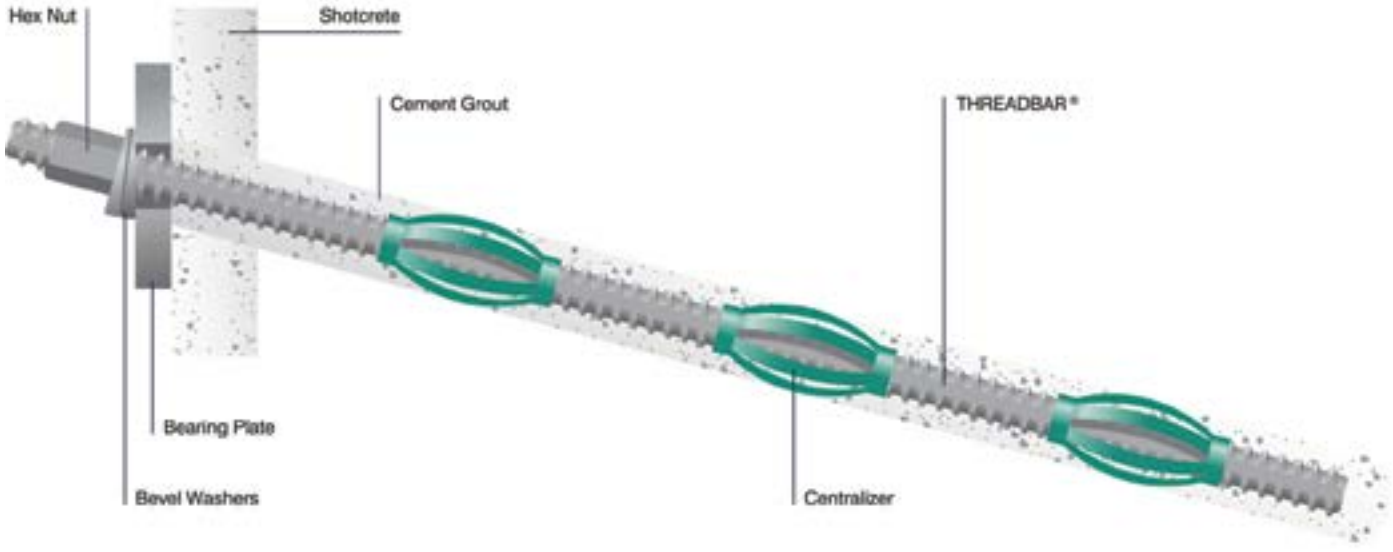
THREADBAR® SOIL NAIL WITH DCP FOR THE MOST AGGRESSIVE SOIL CONDITIONS



THREADBAR® SOIL NAIL – BARE, EPOXY COATED OR GALVANIZED



KEY FEATURES

- Top-down construction
- Lower construction costs versus tieback walls with soldier beams and lagging
- Can be used for temporary and permanent applications
- Simple components and assembly
- Easy to install and test
- Durable full length threads allow for cutting and coupling the bar at any point along its length

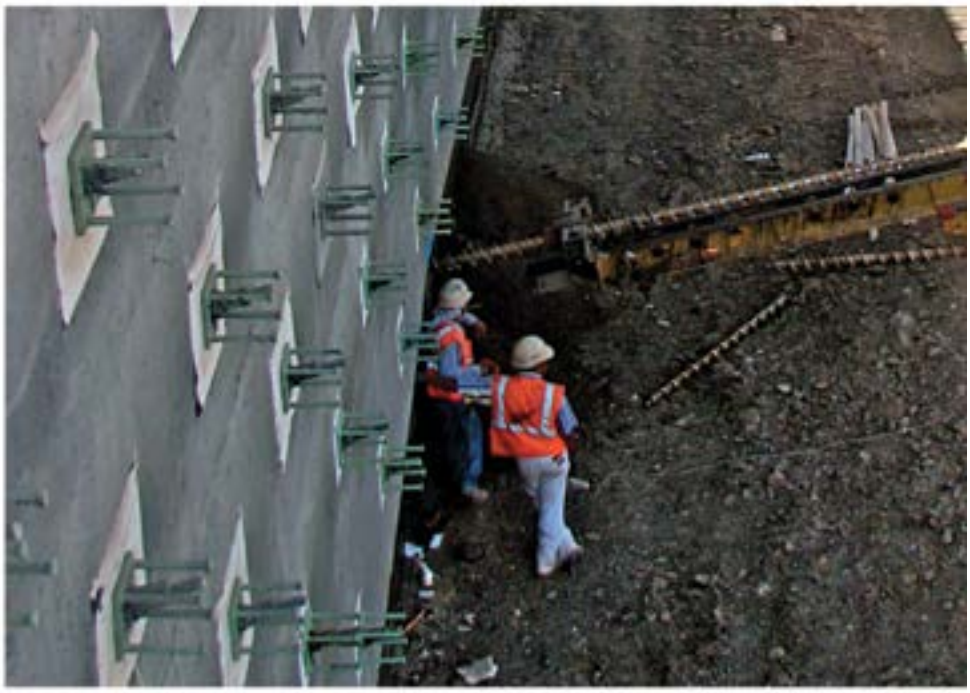
THREADBAR® with Centralizer



THREADBAR® ANCHORS

KEY FEATURES

- Threadbars with proven coarse thread along the entire length. Bar
- length can be adjusted on site without any problems
- Variable anchor head and angle compensation designs
- Easy handling, tensioning, retensioning or detensioning
- Can be utilized for fully or partially removable anchors
- Can be supplied with Double Corrosion
- Protection (DCP) for permanent applications

FIELDS OF APPLICATION

- Excavations
- Tiebacks
- Rock and slope stabilization
- Tiedown anchors

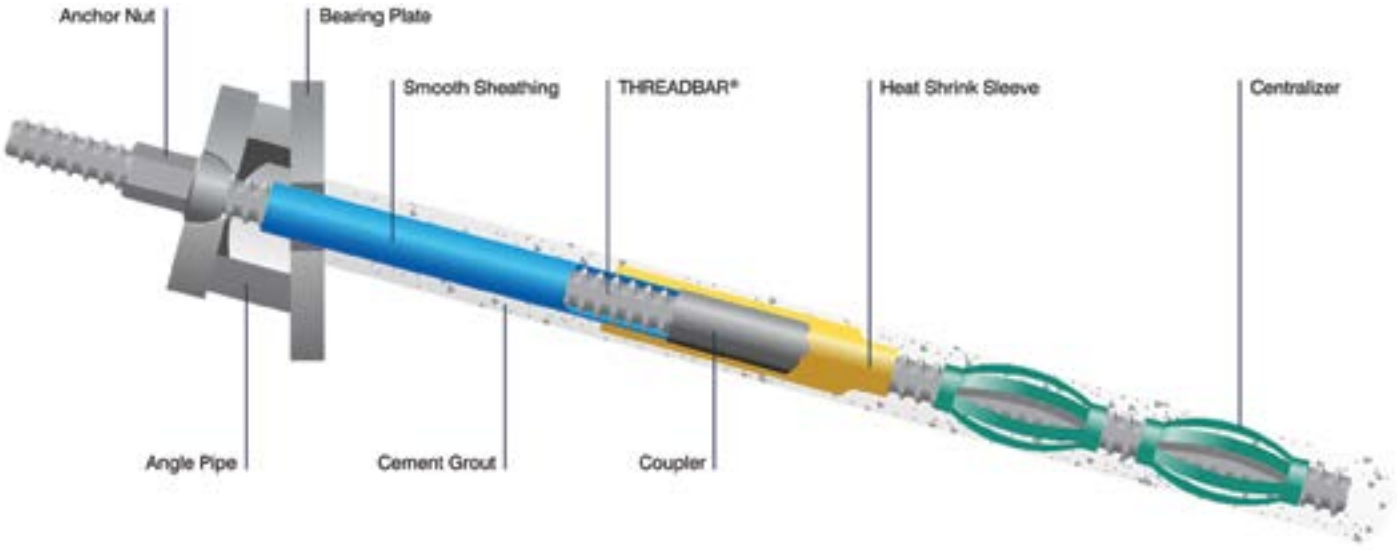
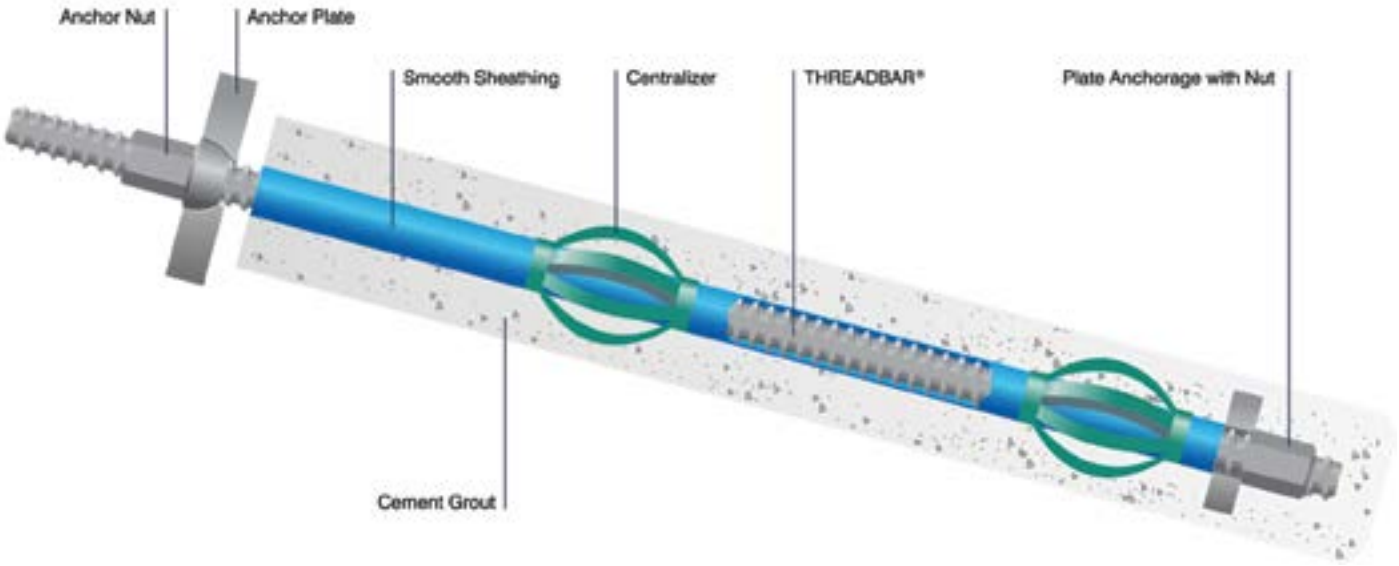
WARNING: DO NOT WELD on or near A722 prestressing bars or their anchorages.

THREADBAR® ANCHOR – PARTIALLY REMOVABLE



THREADBAR® ANCHOR – FULLY REMOVABLE

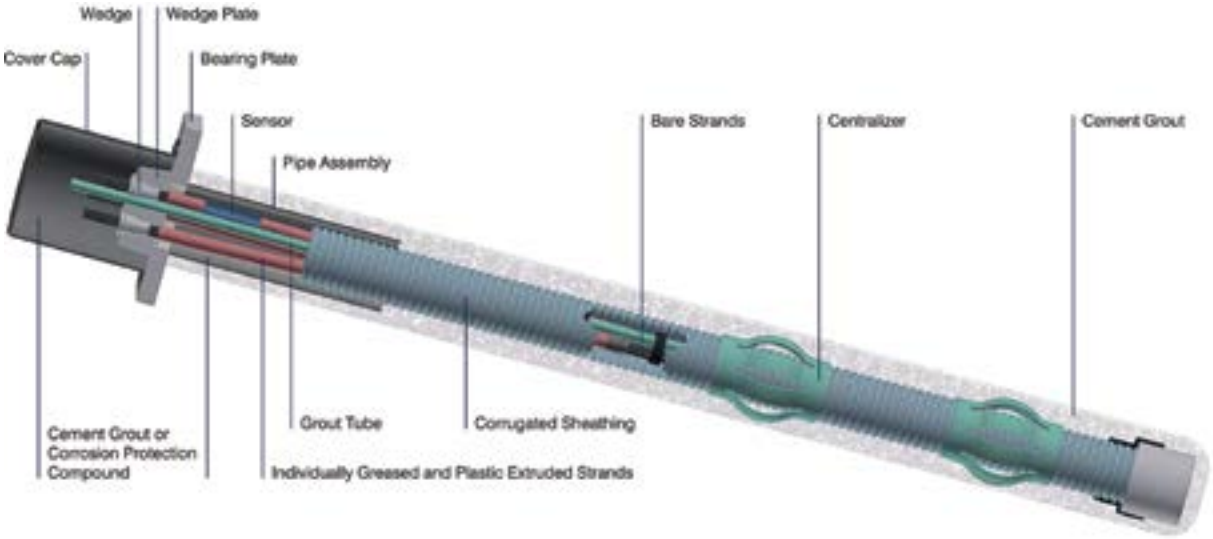


PERMANENT (DCP) ANCHOR – KEY FEATURES

- Long-lasting system for permanent use
- Variable anchor head and angle compensation designs
- Double Corrosion Protection (DCP) is achieved by protecting the strands with barrier against corrosion. It consists of a corrugated sheathing, a pipe welded to the bearing plate and a cover cap along with encasement in cement grout.

FIELDS OF APPLICATION

- Retaining walls
- Rock and slope stabilization
- Tiedown anchors
- Excavations



TEMPORARY ANCHOR – KEY FEATURES

- Temporary system for a service life of up to two years
-
- Variable anchor head and angle compensation designs
-

FIELDS OF APPLICATION

- Excavations
- Temporary structures

MICROPILES

BASIC CONCEPT

A drilled and grouted micropile, with a diameter of less than 12 inches. It is centrally reinforced with either one or a group of THREADBARS®. The deformations on the bar transfer the load into the surrounding grout body and friction transfers the load from the grout into the ground.

KEY FEATURES

- Compact lightweight drilling equipment allows for pile installation even in areas with low headroom
- Small economic drill hole diameters
- Drill holes can be placed closely to existing walls or structures
- Vibration free drilling prevents damage to adjacent structures
- Double Corrosion Protected (DCP) bars may be utilized for piles in aggressive ground
- Multiple bars can be installed into a single borehole
- Short bar sections with couplers can be utilized in low headroom locations
- Continuous, coarse thread allows for rough site handling and for easy on site length adjustments since cutting or coupling of the rod is possible along its entire length

DRILL HOLLOW BAR SYSTEM

BASIC CONCEPT

The Drill Hollow Bar System consists of fully threaded steel bar sections, couplers, nuts and drill bits.

It can be drilled and grouted into loose or collapsible soil without a casing.

The bar sections feature a hollow center that allows for a simultaneous drilling and grouting operation.

The Drill Hollow Bar serves as a drill rod. It is fitted with a lost drill bit at the front that can be adapted to different ground conditions. After each single bar section of 1 to 6 m, the subsequent bar is coupled to the previously installed section.

During drilling, cement grout is injected into the hollow core of the bar using an injection adapter that is mounted on the drill rig. The cement grout exits at the bottom end through openings in the drill bit. The injected grout initially serves

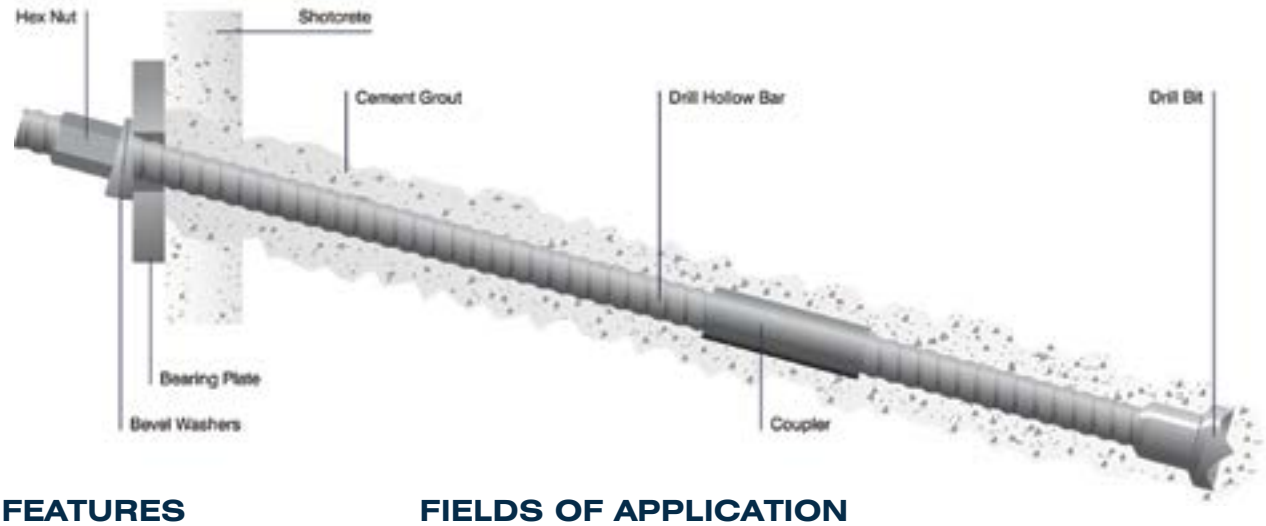
as slurry to stabilize the borehole and ensures the efficient flushing of the drill spoils. Once the grout reached strength it bonds the bar to the ground.

Once the required installation depth has been reached, the hollow bar serves as a steel tendon and can carry out its function as a soil nail, rock bolt or pile upon the grout reaching its required strength.

The comprehensive Drill Hollow Bar System product range offers tendons with ultimate loads from 45 kips to 832 kips including all system components such as drill bits, couplers, spacers and anchor heads.

Additional installation tools such as injection adapters can be produced customized or adjusted to job site requirements on short notice.

DRILL HOLLOW BAR – SOIL NAIL



KEY FEATURES

- The tendon simultaneously serves as a drill rod
- Extremely fast installation because borehole drilling is made redundant by simultaneous drilling and grouting
- System can be installed in confined spaces utilizing simple and compact drilling equipment
- Variable anchorage and angle compensation designs
- Irregular grout body enhances capacity
- Drill bits are available for various ground conditions
- Can be used as a soil nail, rock bolt or a pile

FIELDS OF APPLICATION

- Slope, embankment and rock stabilization
- Shoring and excavations
- Fixation of rock fall mesh
- Avalanche barriers
- Foundations
