## The lifecycle of Sunflower

A sunflower is a flower that has beautiful yellow petals. It can grow quite tall.

The seed  
First a seed is put in soil. With enough water, sun, and nutrients the seed will crack

and start to grow. This is called germination.

The shoot

a small plant sprouts out of the ground.

Thick leaves appear over time. The plant needs

lots of water and sun.

Wow! Well done, Zenna.

Look at your beautiful cursive handwriting!

You have thought carefully about your explanation text and included all the necessary information. Brilliant work, well done!

The flower  
Next comes the bud. After a while a beautiful flower appears.

The flowers are... has and in excess of 1000 flowers. The flowers are polinated.
