Modern Systems for Procedural Care

OnSet Health builds modern workflow systems that increase efficiency for procedure-heavy specialties across clinical documentation, care coordination, billing optimisation, and audit.

From referral to post-procedure recovery, OnSet creates a shared operational layer across the patient journey, supporting surgeons, proceduralists, anaesthetist assistants, clinical teams, and administrative staff. The platform can operate as a fully integrated system or as an overlay alongside existing clinical systems.

“ We started with a big goal: to improve how patients experience healthcare, especially through the complex journey of medical procedures. There are so many moving parts in procedural care that we felt lost at the onset. With the support of ANDHealth, and specifically the CHICC program, we gained much greater visibility on the path ahead.

The program gave us fresh perspectives on product development, market pathways, and how to measure real-world impact. It also connected us with a community of medical innovators where we could share each other's experiences, making the journey clearer, more connected and more focused.
