Yukka

Gartner COOL VENDOR 2022

WINNER CATAPULT: GREEN FINTECH Luxembourg 2026

Ten years of history. One model. Zero regime breaks.

We sent our newest NLP back through a decade of news — and let it re-score everything.

THE SEAM

When data vendors upgrade their models, history usually remains untouched — scored by the old model, spliced to the new one at the upgrade date. An invisible seam in every time series, sitting exactly where your backtest won't detect.

THE RE-READ

We took a different route: our latest NLP release re-analyzed **300 million articles spanning ten years** of global financial news. The entire archive, one model version end to end. Point in time, no mixed vintages and no before-and-after asterisk.

SMARTER, AND FOCUSED

The model doing the re-reading is a sharper analyst than the one it replaced. It links companies more precisely — and it learnt to stay focused: sentiment scores on boilerplate and sentiment-free text narrowed from roughly a third of company mentions to under one in ten. Cleaner entities, less noise and stronger signal.

300 M	10 yrs	94%
articles re-analyzed	one consistent model	entity precision (from 87%)

GREATLY IMPROVED ACCURACY OF SENTIMENT DETECTION

Of every 100 company mentions, how many got a sentiment score they shouldn't have?

Sentiment assigned to boilerplate or sentiment-free text · internal benchmark, Oct 2025, de+en

SAME SENTENCE, SMARTER READ

"Jyske Bank raises 2025 earnings outlook on strong performance.	neutral → POSITIVE ✓
"UBS restated a 'sell' rating and set a 2,200p price target on Bunzl."	neutral → NEGATIVE ✓
"One Bolloré stock can currently be bought for about EUR 4.88."	positive → no signal ✓

Real examples from our benchmark set — each new label independently verified. (The third: price boilerplate isn't sentiment.)

WHAT THIS MEANS FOR YOU

Already a customer?	Evaluating Yukka?
Your historical data has been upgraded — re-scored values may differ from extracts you pulled earlier. That is the improvement, not an error. Your account manager can walk you through what changed in your universe.	You start with what long-time customers just received: a decade of history and a live feed scored by the same model. Ask us for the benchmark pack — methodology, confusion matrices, and worked examples to deliver what you need.

WHAT'S NEXT

- Entity detection — broader company recognition, especially for smaller and rarely-covered names: sharpening event detection data sets and risk screening for private company universes
- Language coverage — Spanish, French, and Italian archives complete the same reprocessing next

Every future upgrade follows the same principle: when the model gets smarter, your history gets smarter with it.

The model scoring today's news now reaches back to 2016.
Your backtest finally runs on the same brain as your live feed.

Validated on 180,000+ LLM-adjudicated annotations across the full STOXX 600 universe, 11 sectors, on identical article sets processed by both model generations. Sentiment accuracy, entity precision, and false-positive rates improved in every sector. Full methodology and confusion matrices available on request.
